Contents

Highschool
2016-2019

University 2019-2026

Education:

Bachelor's and Master's degrees in Architecture at University of Beira Interior 2019/2026
(finishing Master's Thesis until january)
Erasmus Exchange: Politechnical University of Crete 2024/2025

Something about me:

Passionate about alternative model making and interested in Architecture with natural materials.
Also interested in Free and Open-Source Software applicable in Architecture.

Software Skills

- Working knowledge: AutoCAD, GIMP, Photoshop, Affinity software and SketchUp.
- Basic knowledge: Illustrator, InDesign, Kdenlive, Premiere Pro, FreeCAD and QGIS.
- Currently learning: Revit, Blender and Python.

Competitions:

- MoonCampchallenge 2018/2019
- Luiz Conceição 2022
- Roca's One Day Design 2023

Short internship at Architecture studio Urbitraço, Covilhã (2026)
Worked in the retail industry for 2 summers (2023 and 2024) at Pingo Doce

Personal Information:

André Gonçalves Andrade
Covilhã, Castelo Branco, Portugal

Begginer:	Coding

Lunar Crystal

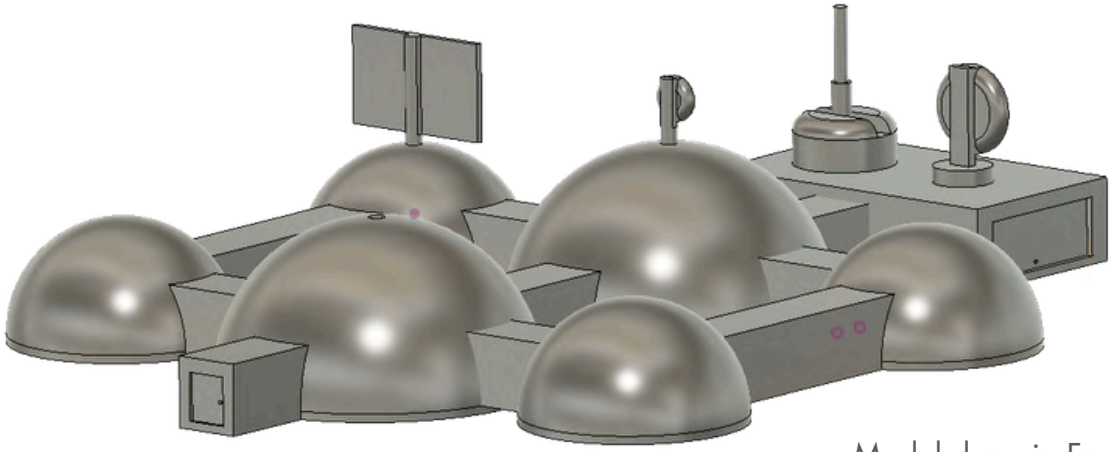

Encampement, Moon

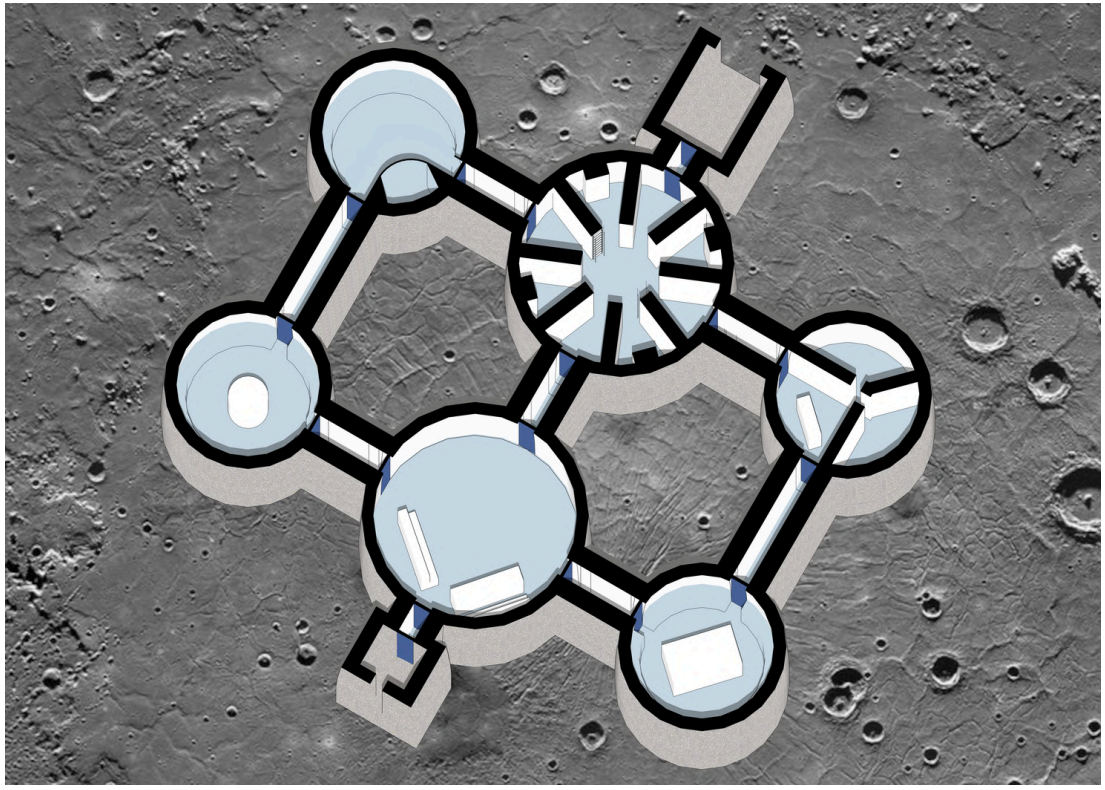

2018/19
Group

MoonCampChallenge
Fundão, but for the Moon

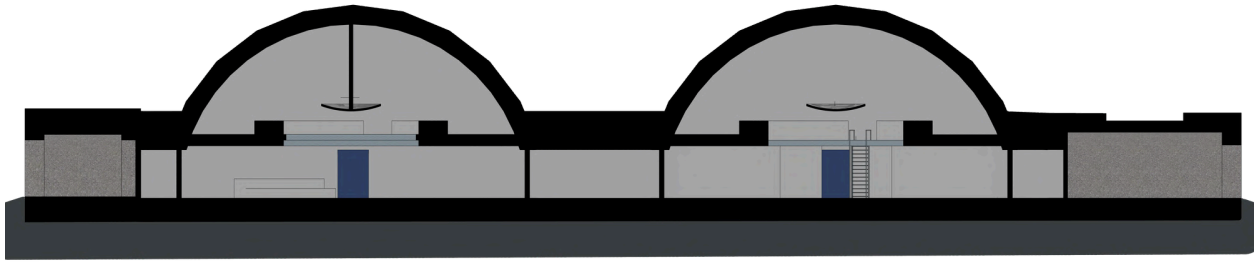

While in secondary school, my group was challenged to design a lunar habitat as part of a Physics assignment inspired by the European Space Agency (ESA). We had little prior knowledge of the subject, but did our best to develop a coherent proposal.
I was responsible for the initial sketches and for modelling the project in Fusion 360. Another group member explored alternative modelling software, using CATIA.
At submission, we did not have the model in the required Fusion 360 file format and received an honorary certificate of participation.

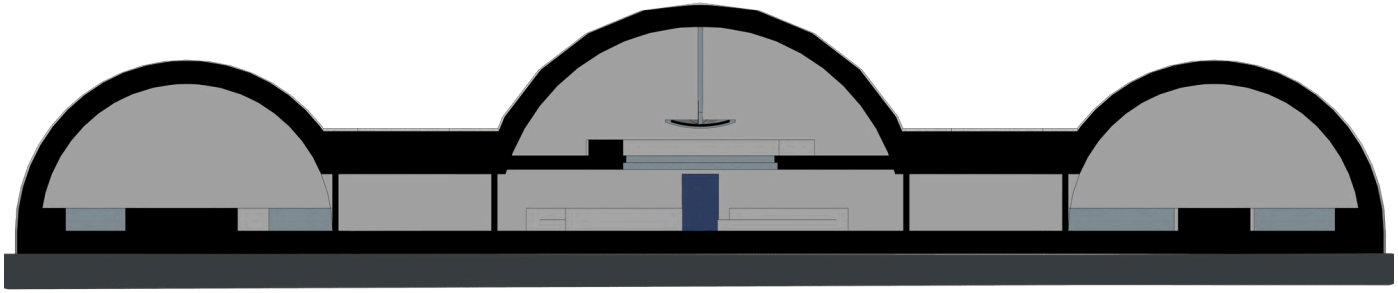

Model done in Fusion 360

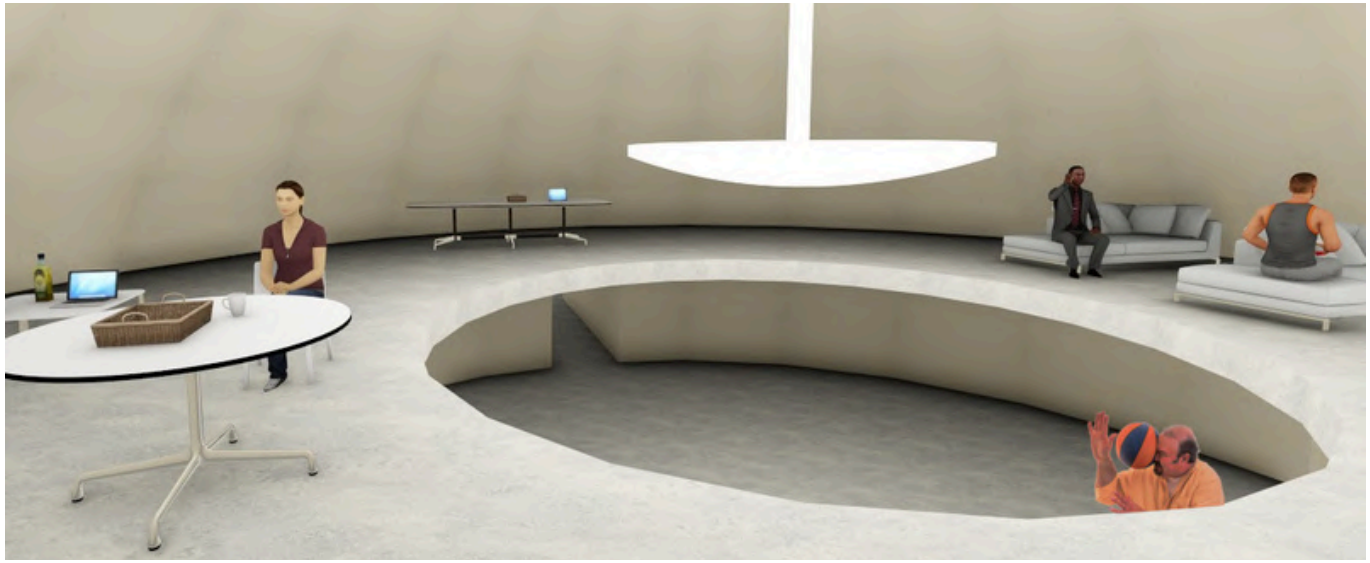

Military perspective
done in Sketchup

Sections of connecting modules

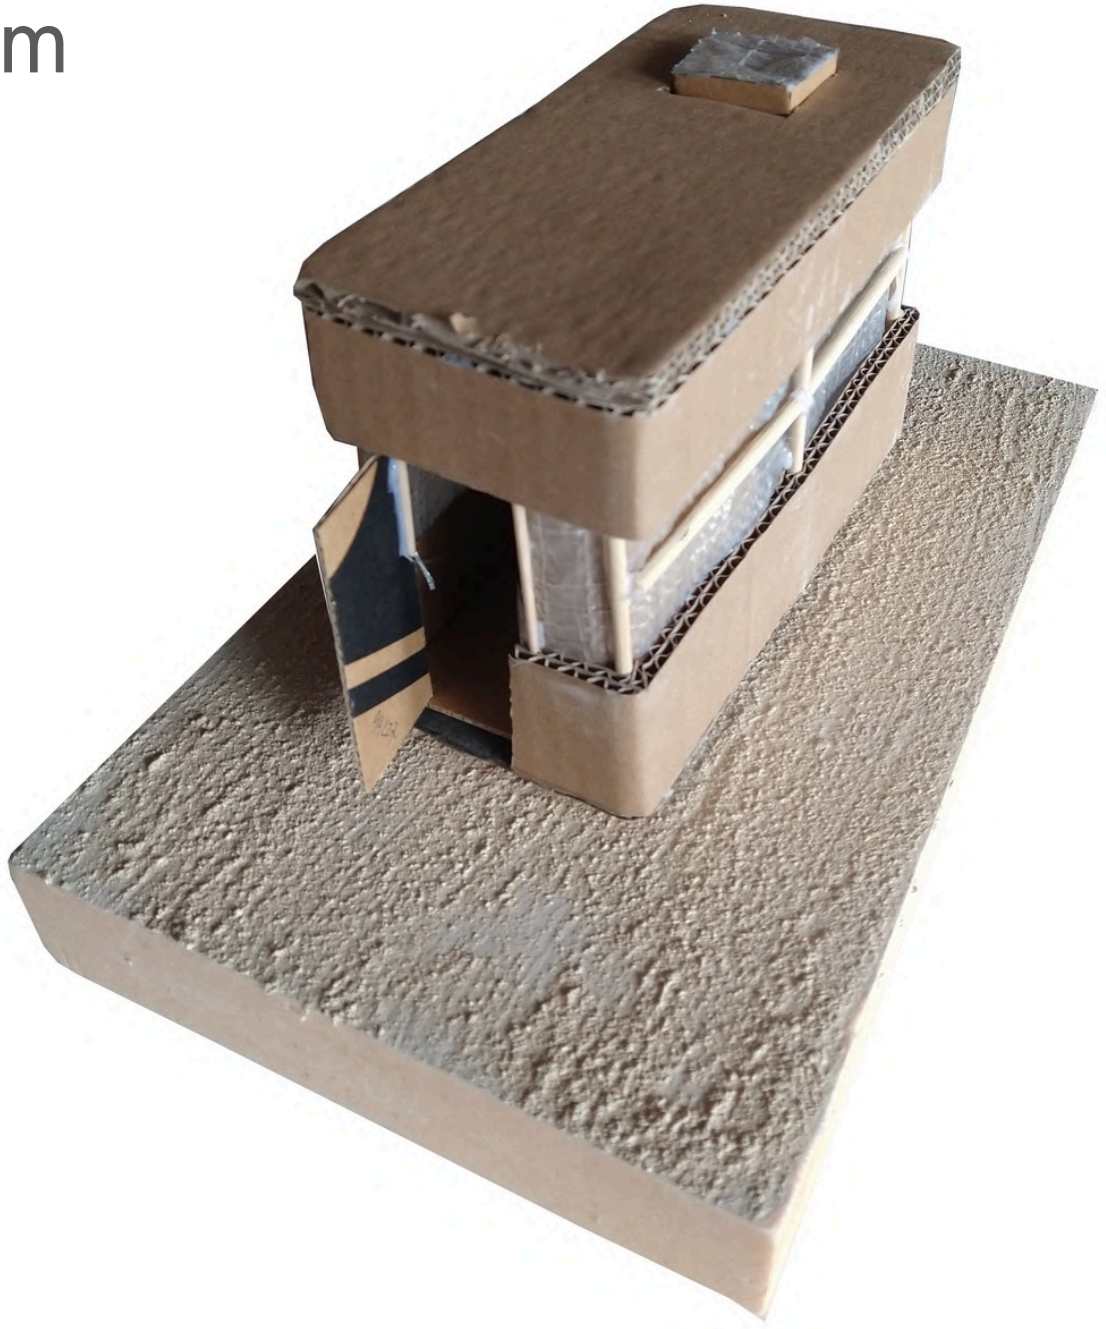

This project was meant to be modular, being constructed one module at a time, utilizing lunar regolith, allowing for more crew and improved communal living over its construction expansion. At its peak, would have modules for living, sleeping, hygiene/ medical care, computational and chemical laboratories, also having a garage for rovers. Proved to be a simple intruduction to a method for further projects.

Photomontage of the living module

Ad Vitam Aeternam

Artist lodging, Morille

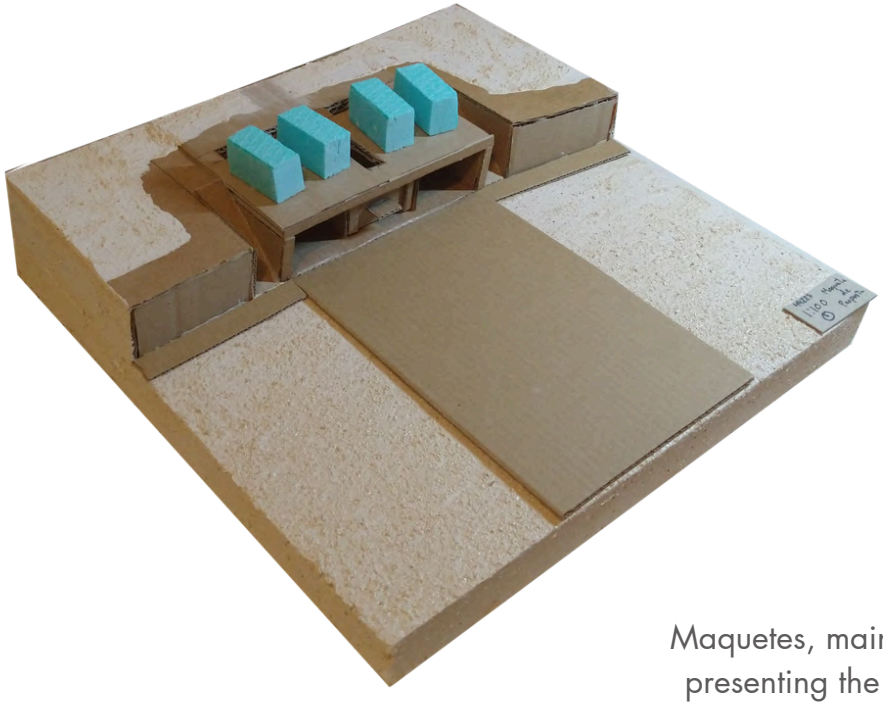

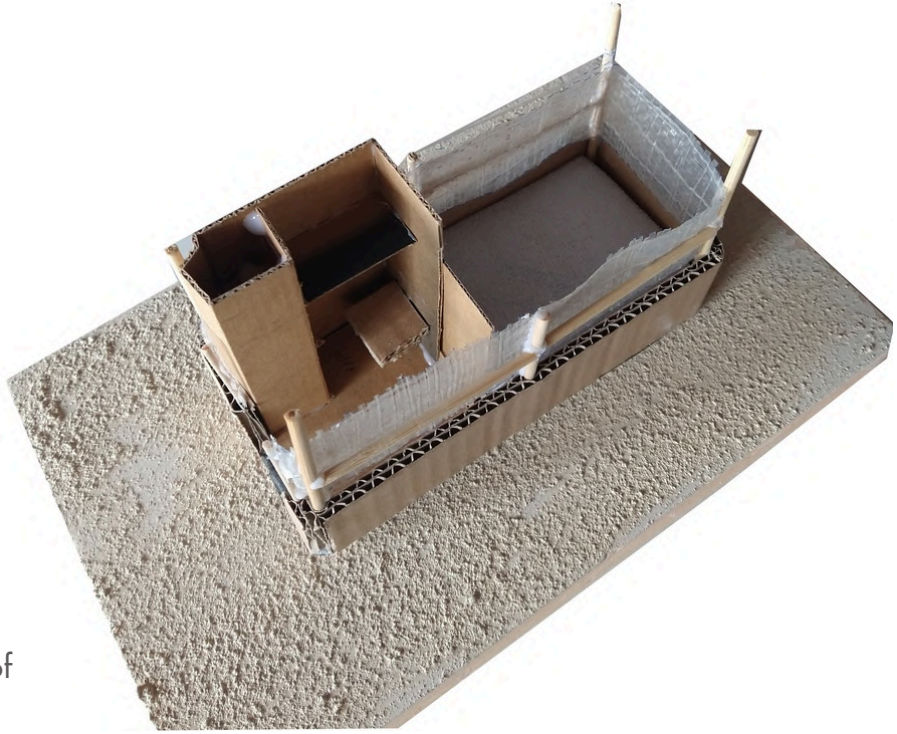

2020/21
individual

Artist Lodging/'Shirne'
Morille, España

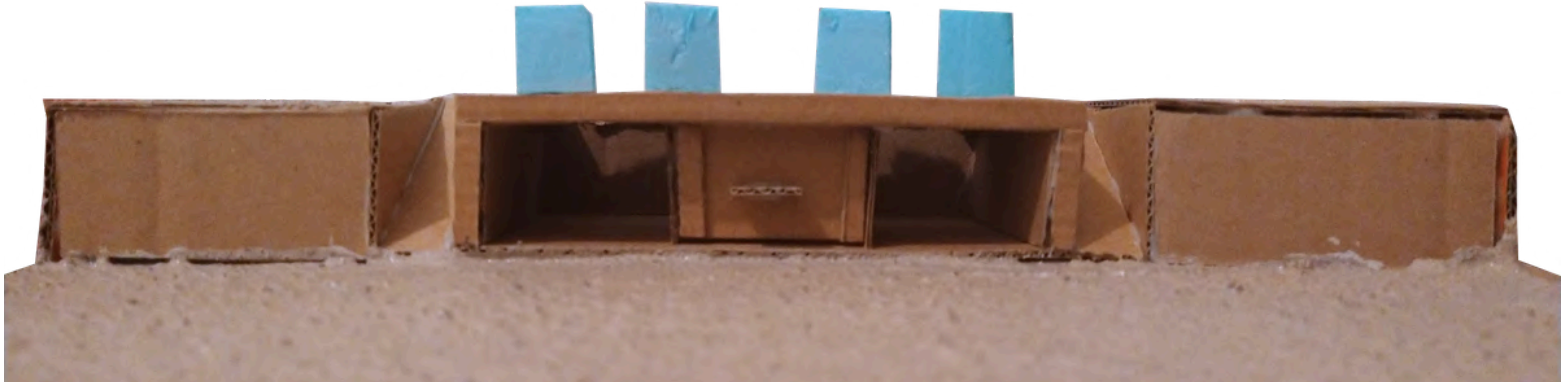

This project focused on the small village of Morille, where artworks are symbolically buried in an extensive grave. This reminded me of tales of ancient celtiberian rituals, megaliths and its monumentality. I aimed to create a ritual place, on a small scale, with the necessary lodging for 4 seperate artists, utilizing the present cabins on the spot, past country's fronties cabins, to foster the graving act (the artist has to feel like living on the frontier between life and death).

Imagined ritual of depositing art, uniting various different forms of art to praise human creations

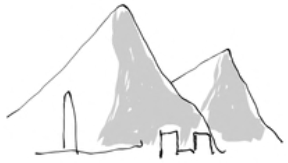

Maquetes, main way of
presenting the project

Casa Criar

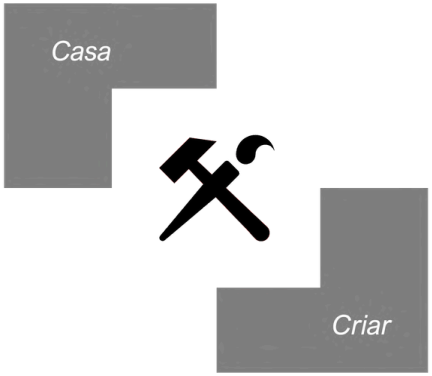

Art creating housing, Covilhã

2021/22
individual

Artist Lodging
Covilhã, Portugal

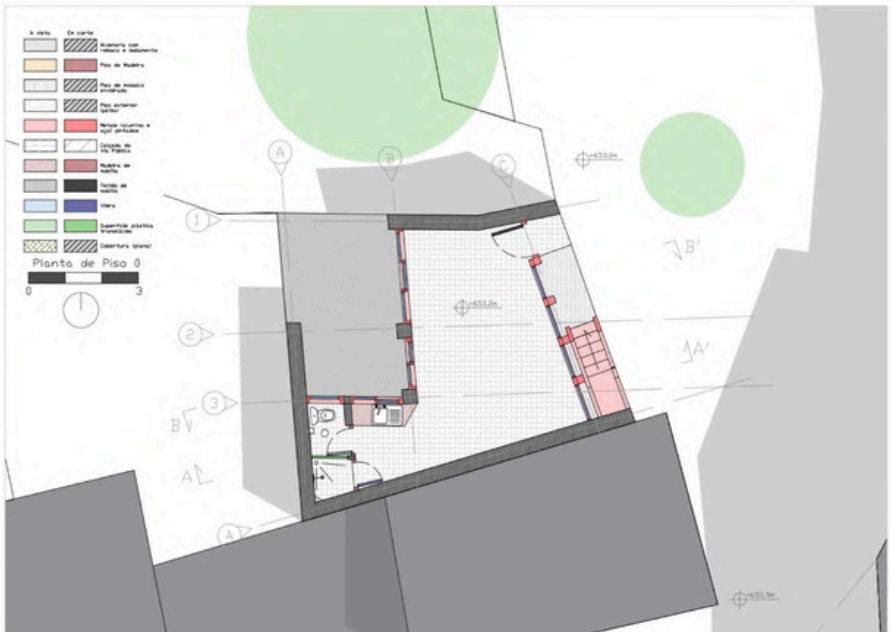

Located on a uninhabited street, this project was aimed to bring life to the public space. Meant to accomodate two artists temporarily, this volume was drawn in such a way that, while allowing for living and working places separately, both can be connected visually through the mezzanine that is the living room.
This was my first serious attempt at architectural rendering.

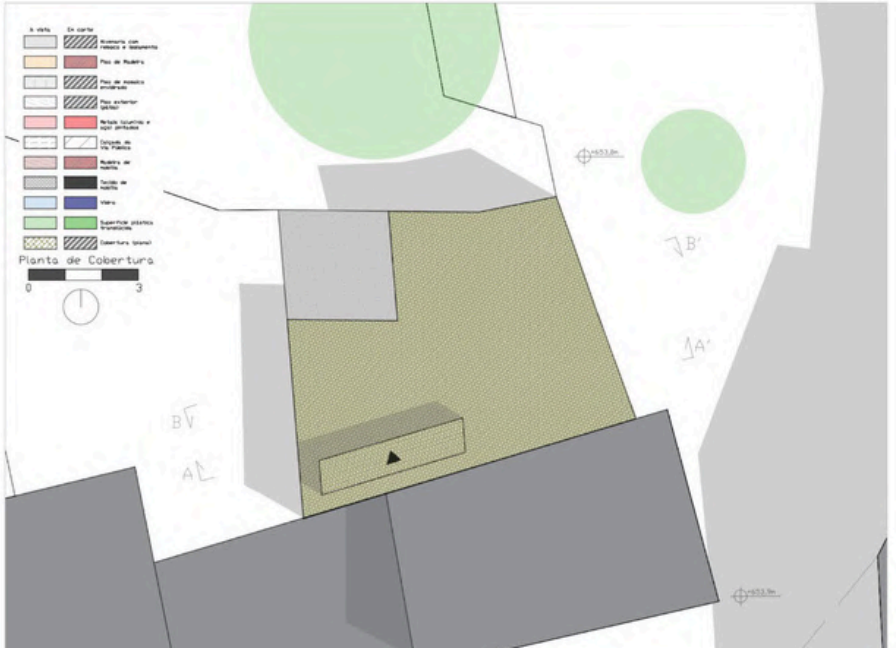

Sections: Lower floor for art creation, upper for living

EduBridge

Educational facility, Covilhã

2021/22
individual

Educational Bridge
Covilhã, Portugal

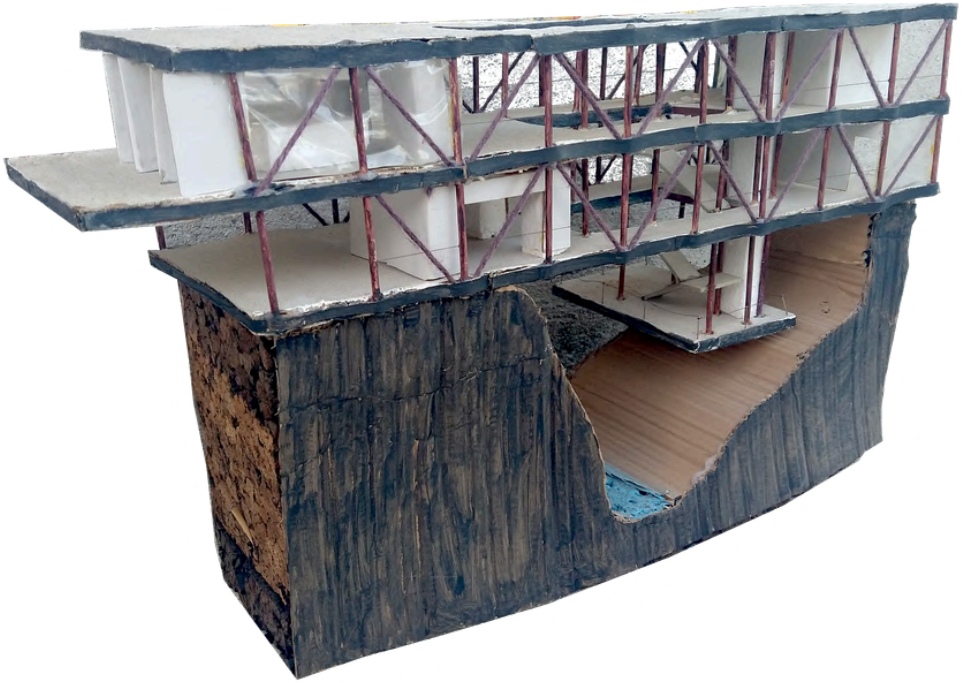

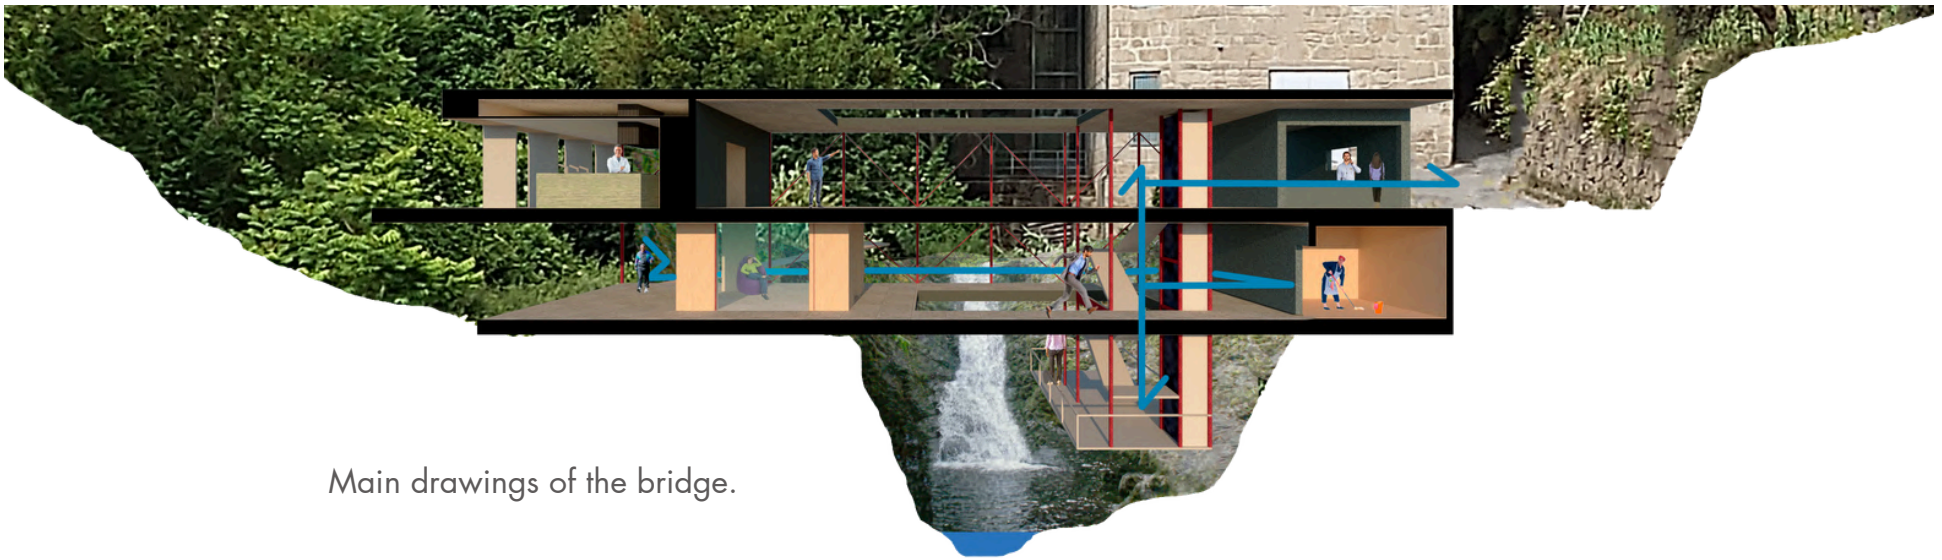

Final maquetes

Challenged by Museu dos Lanificios, part of my home university for an educational centre for youths to learn about the museum's theme, wool history on Covilhã. I intended to also solve another issue many architects tried on this town before: accessibility. That's why I chose a bridge-like structure, to allow access to different museum's areas, while at the same time allowing the minimal occupation of soil (and nice view down the valley).

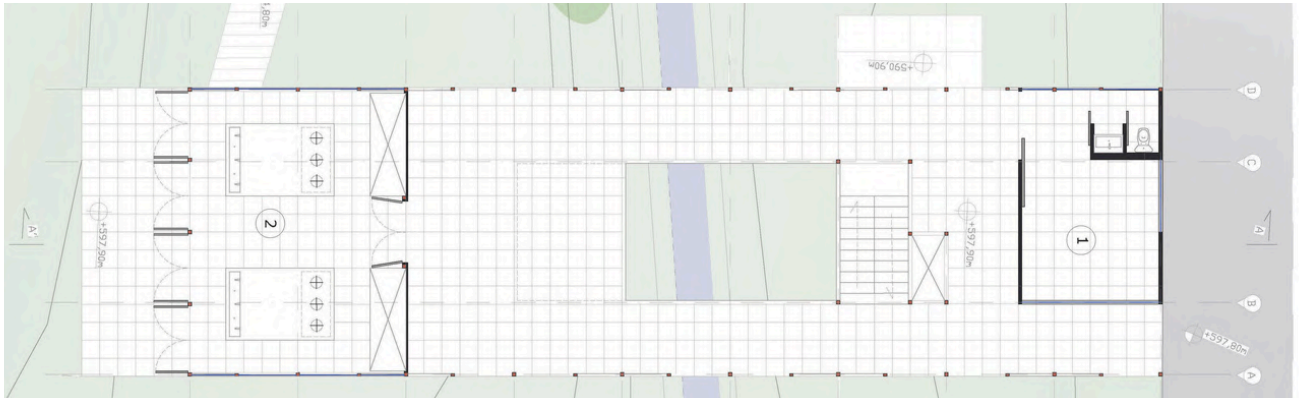

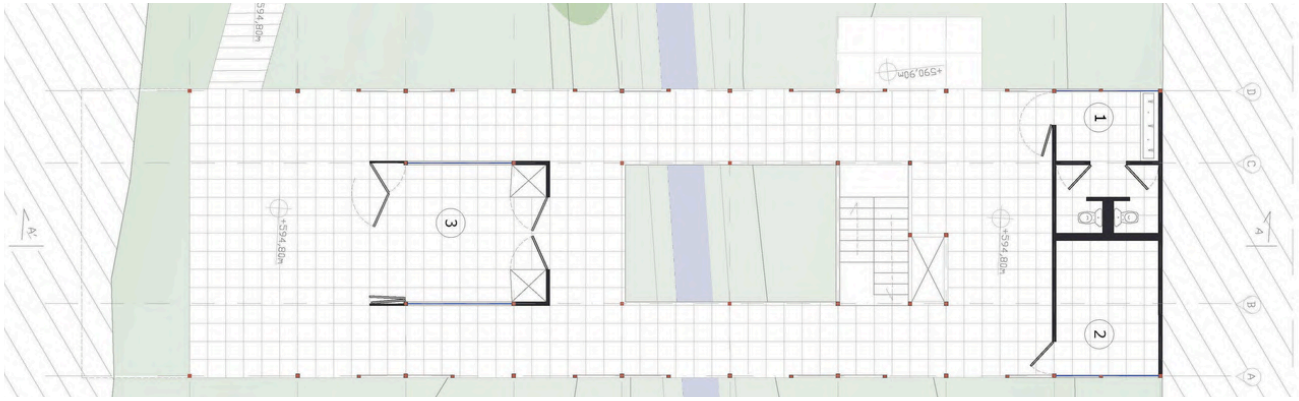

Wool inking laboratory

Main drawings of the bridge.

Socially coliving

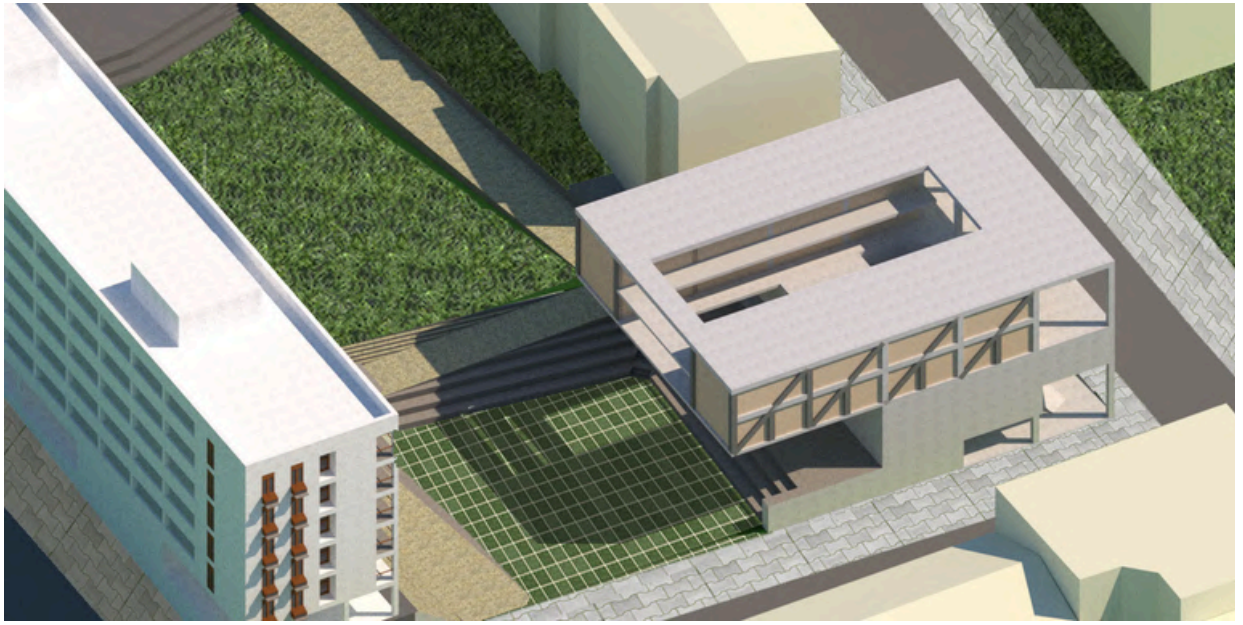

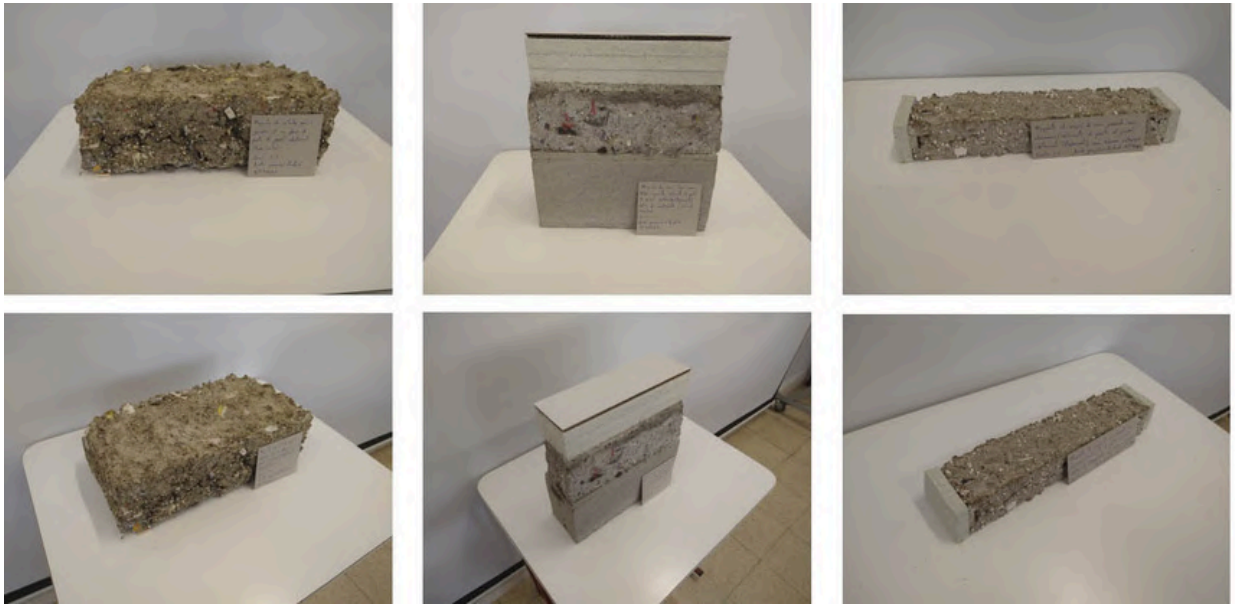

Social housing & coliving lodging, Fundão

2022/23
individual

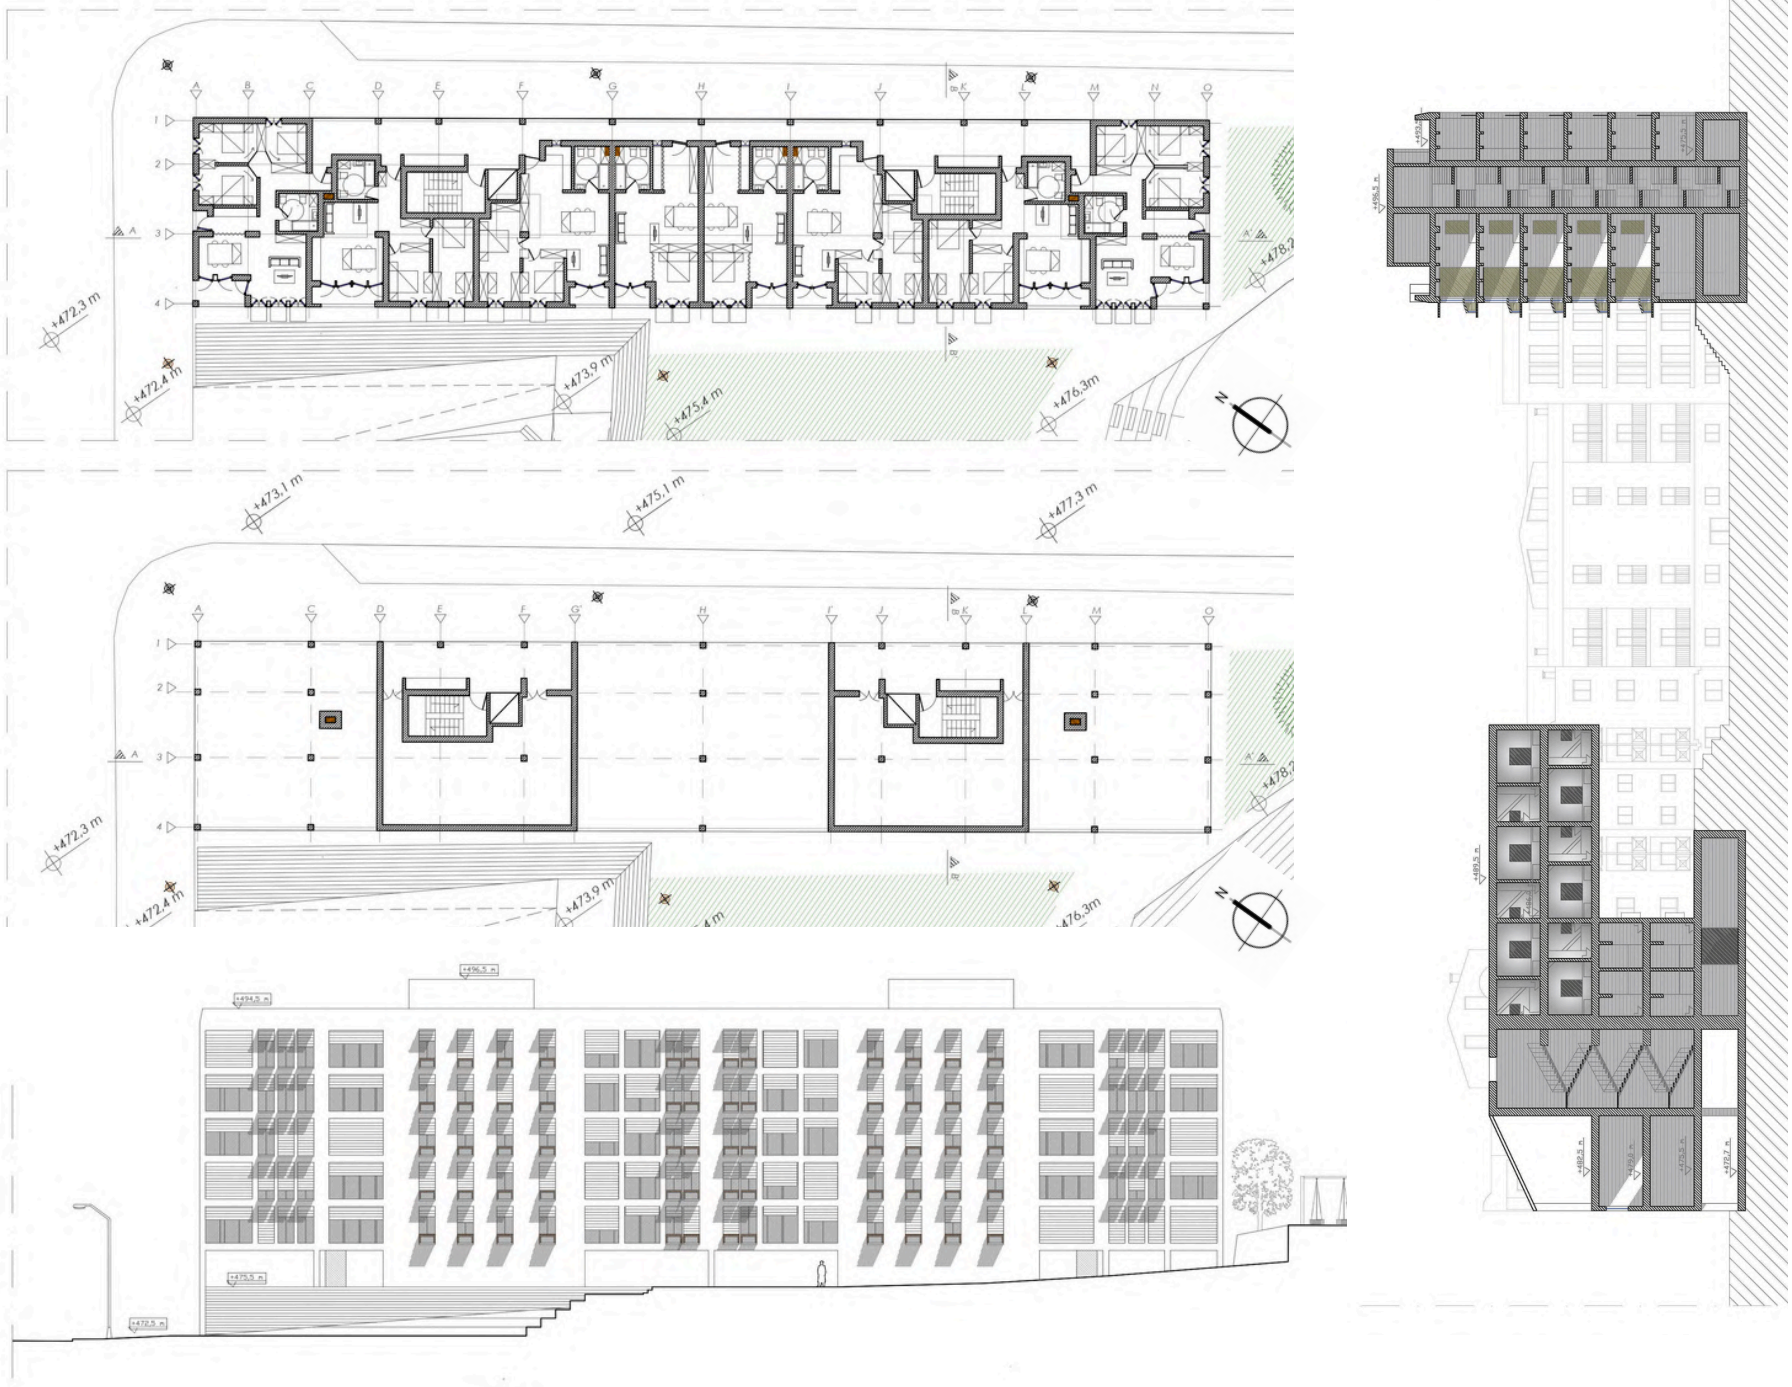

Social Housing & coliving
Fundão, Portugal

Fundão is a small town, currently attracting newcomers to boost its population. Were required 2 complexes: social housing and ephemeral housing for immigrants/people in need of a roof. The social housing is a big block to allow a barrier from this area to the municipal cementery, allowing also a closing of the plaza. As for the ephemeral lodging, the idea was of providing distancing between occupants and street walkers, while being at the same time a shading object for the plaza, since summers in Fundão often surpass 40ºC. Since winters reach bellow 0ºC, I thought a good thermal mass and insulator would be a nice implementation, proposing papercrete (more on this material in last chapter).

Torre de (Ho)menagem

Gathering landmark, Trancoso

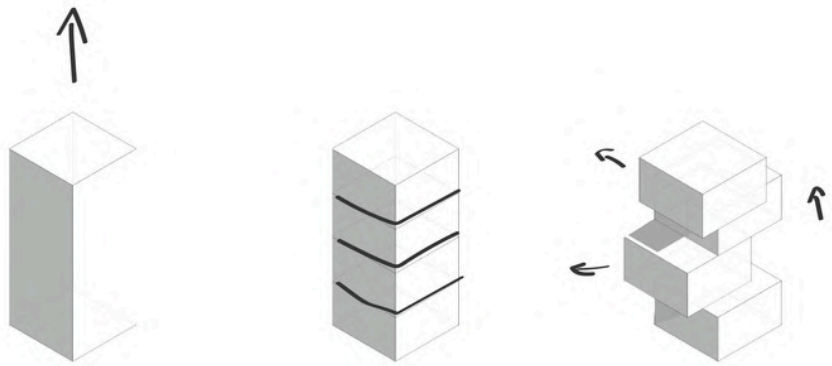

Sectioned perspectives of the tower

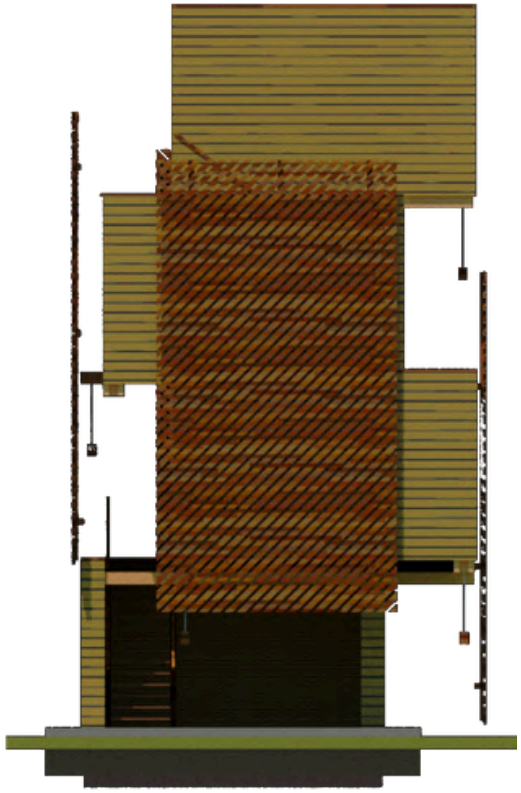

2023/24
Group

Cultural gathering places
Trancoso, Portugal

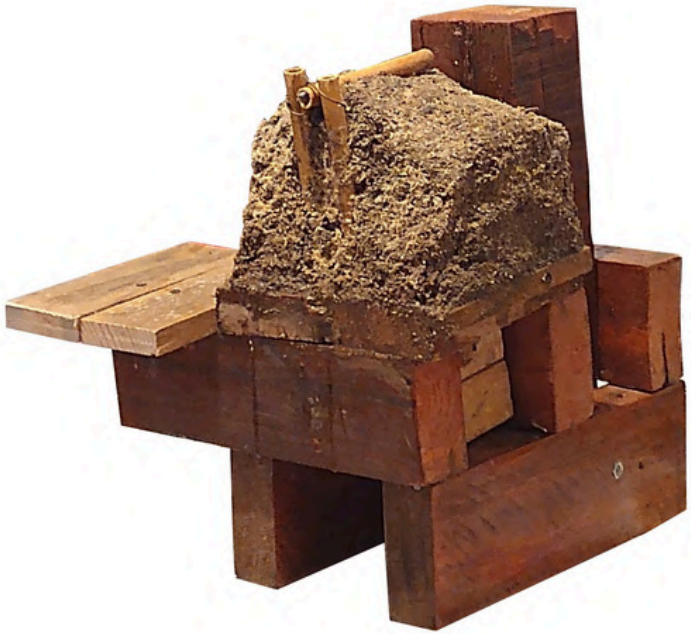

Thought process

As an initial response to a town we were still getting to know, we proposed a tower made of timber and earth within Trancoso's elliptical castle.
I strongly advocated for rammed earth as the primary material, despite initial reluctance within the group. My contribution extended across much of the design process, including the development of the material strategy.
The tutor became closely involved in our discussions and helped guide the project towards a more resolved proposal.

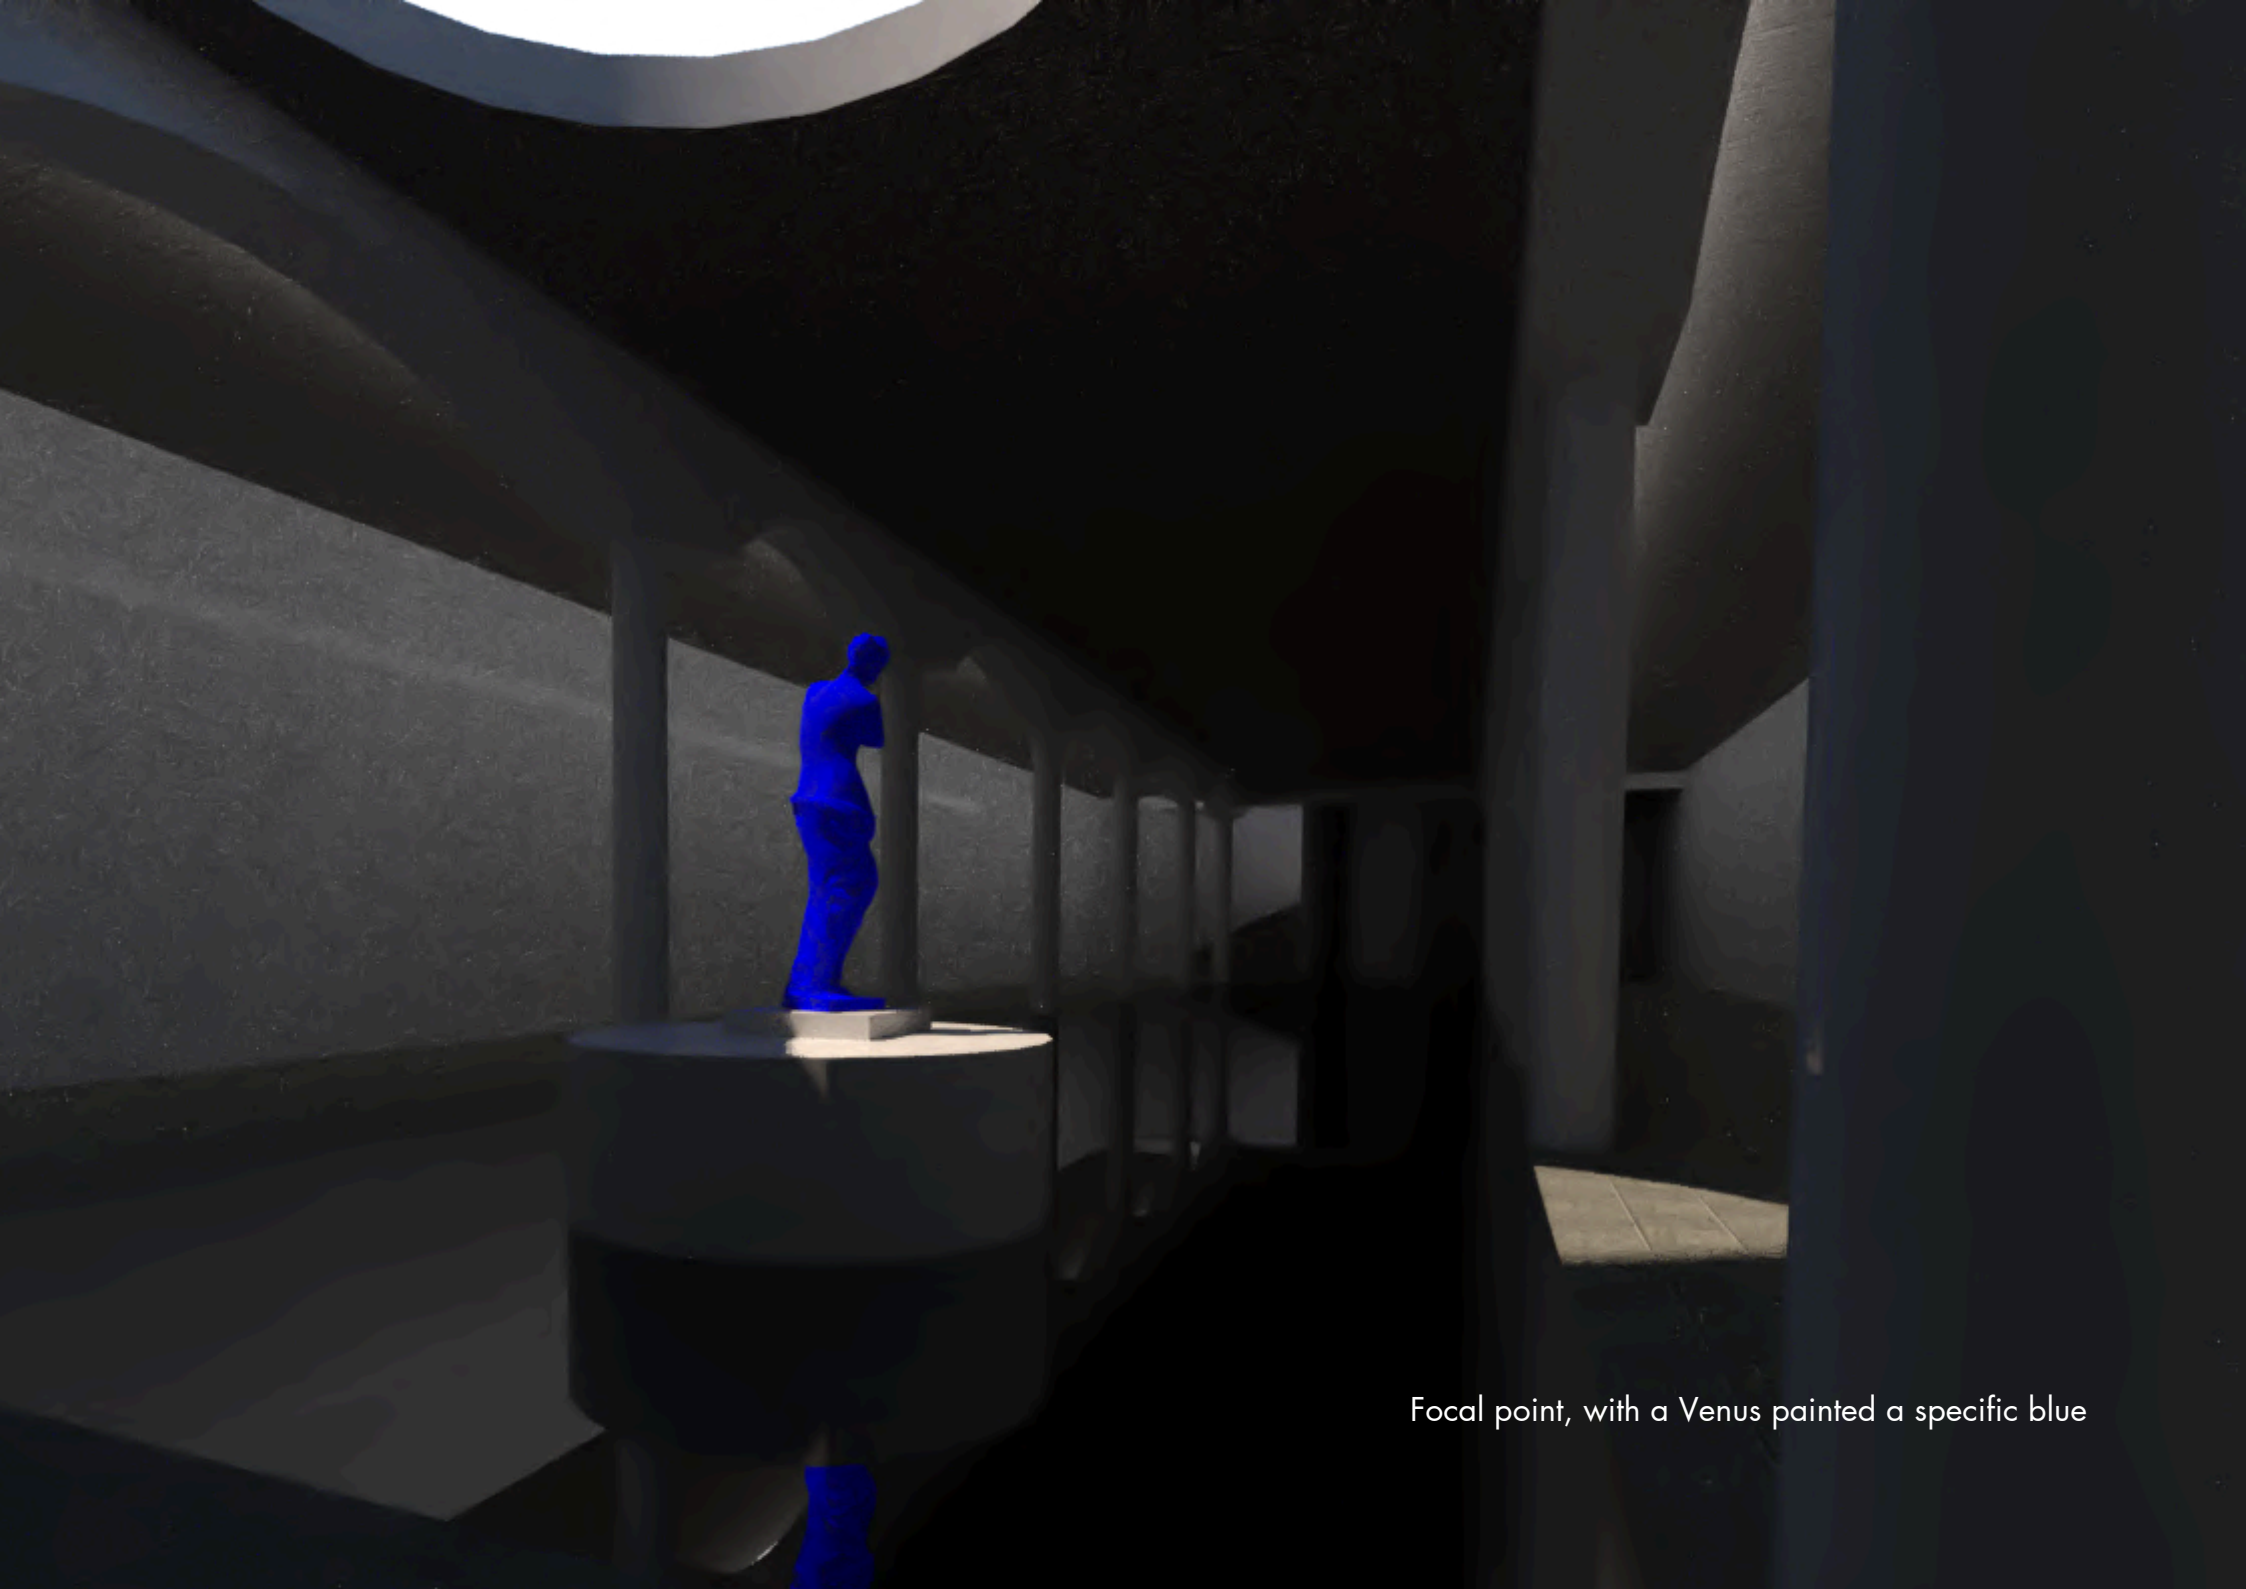

Façade

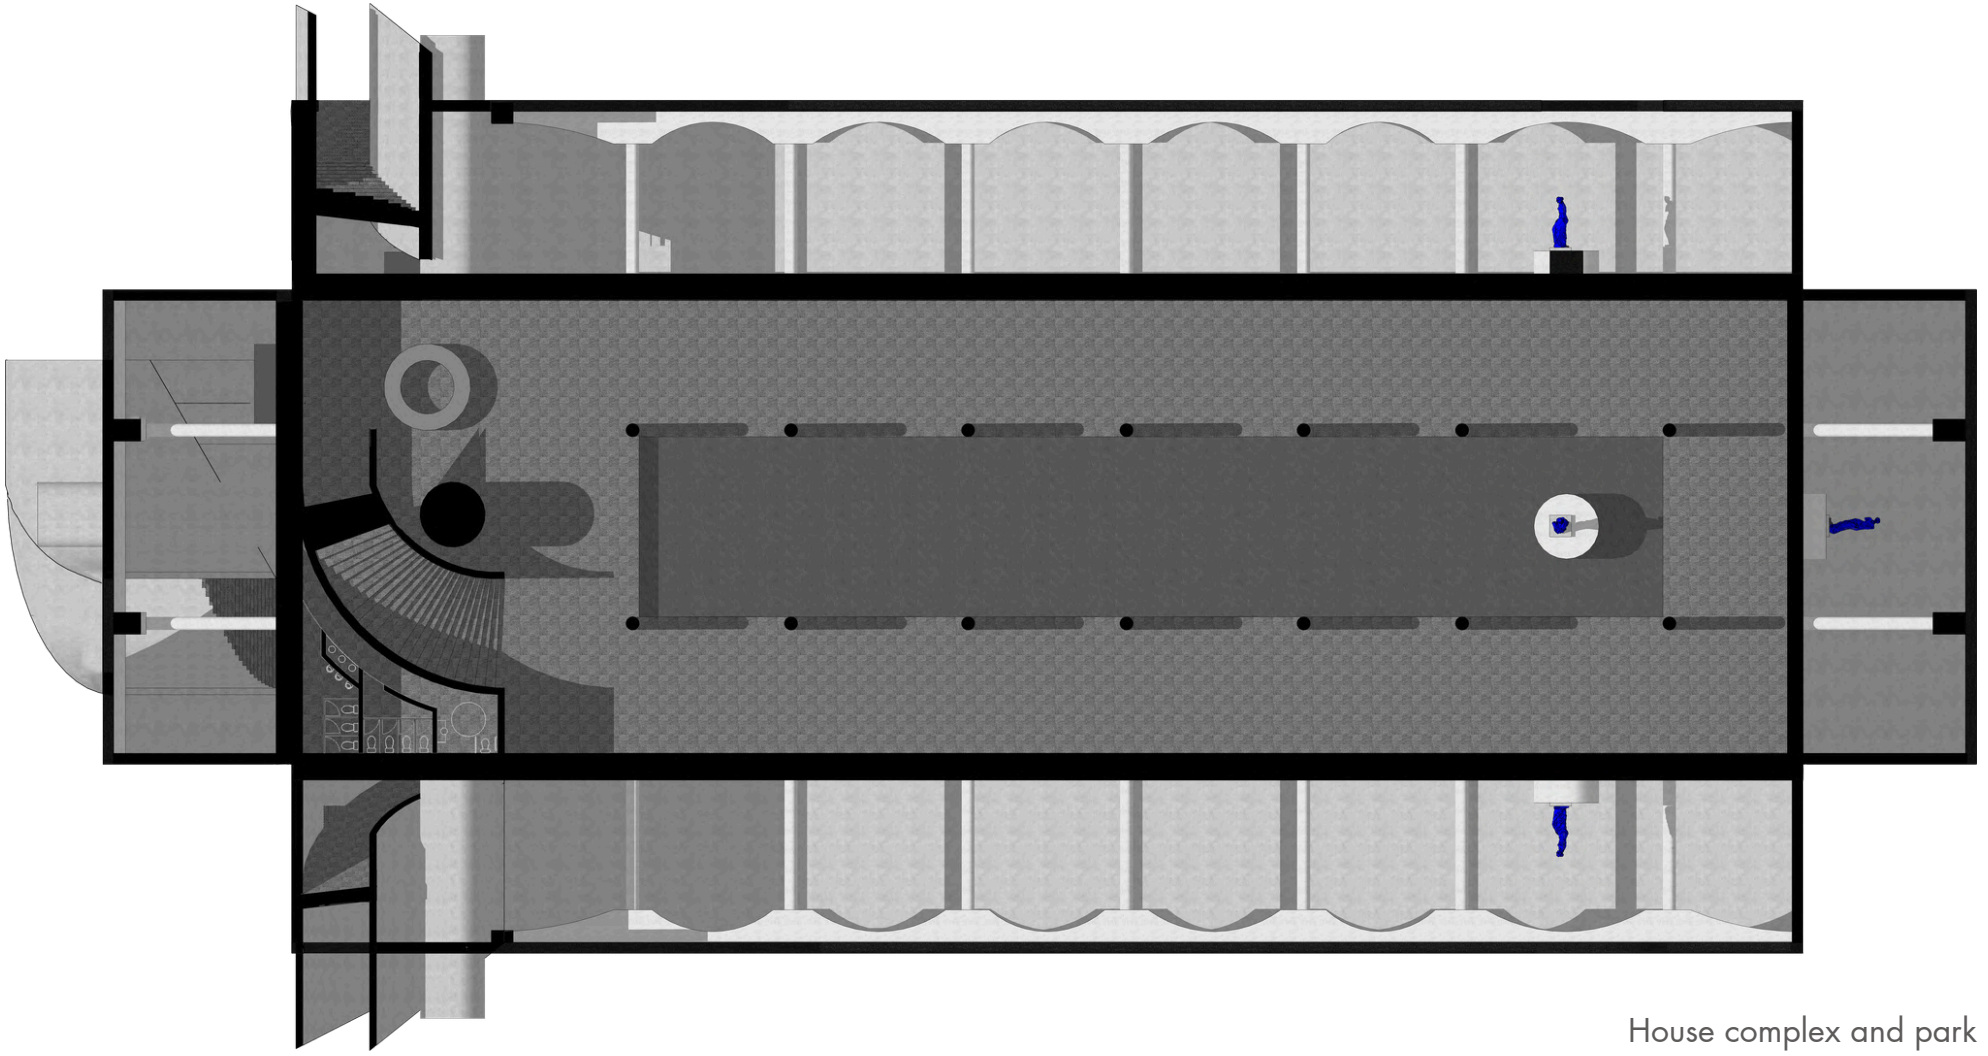

Nodal maquete with wood structure and reeds' reinforced rammed earth wall

Underground
Art gallery, Trancoso

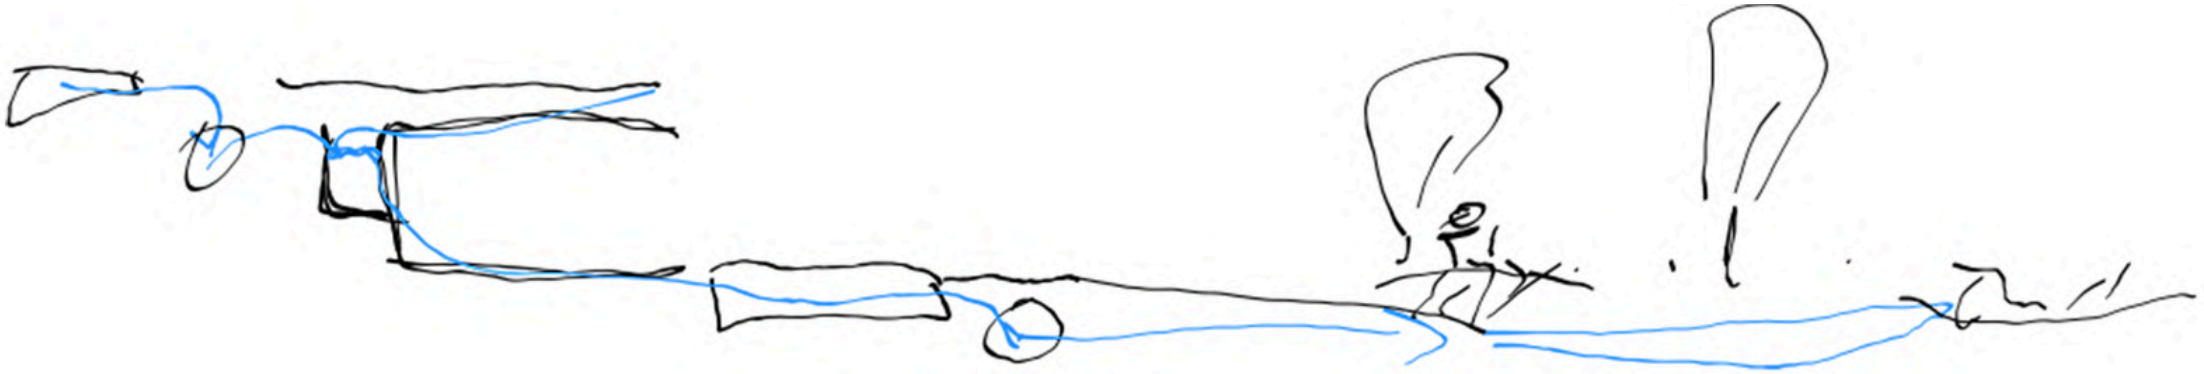

Focal point, with a Venus painted a specific blue

Following an initial project for the site and a closer understanding of the town, we developed a proposal for an underground art gallery.
My contribution focused on the visualisations and sectional perspectives, building on the spatial and architectural context established in the previous project.

House complex and park

Human&H2O

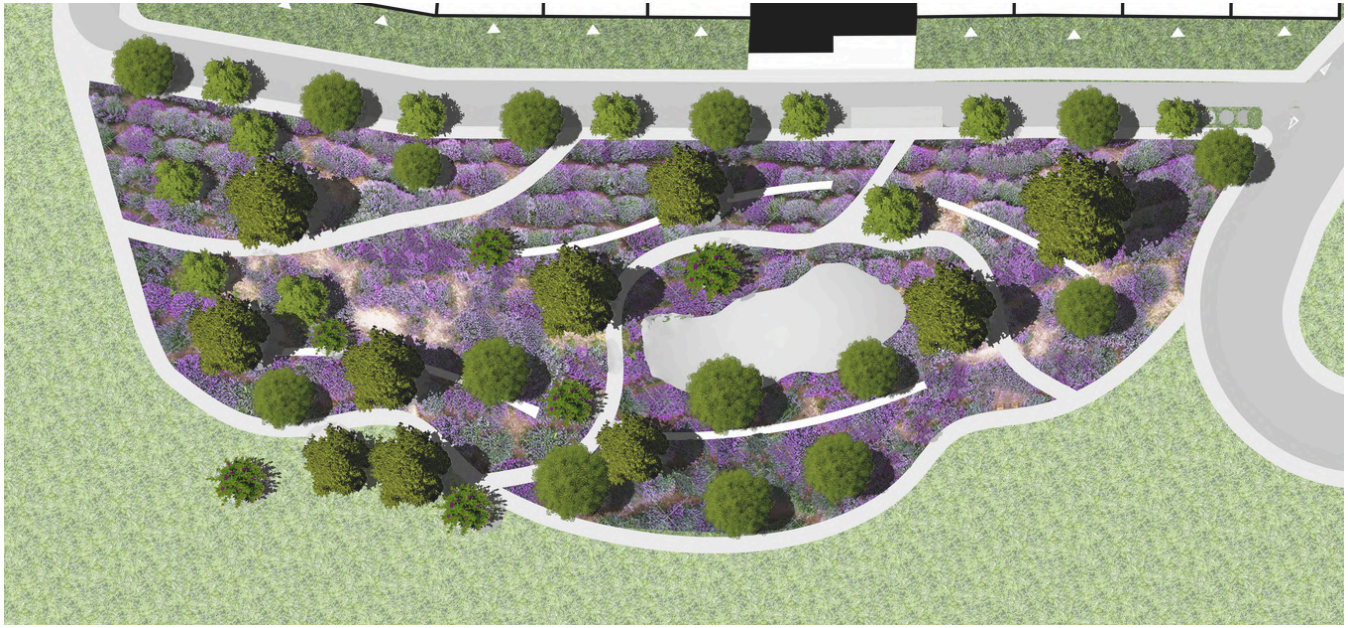

Water path diagram, from rain and household, filtered on the private house soil, the conducted the the lower lake

Small urban planning, Trancoso

2023/24
Individual

Residential Housing and Urban Planning
Trancoso, Portugal

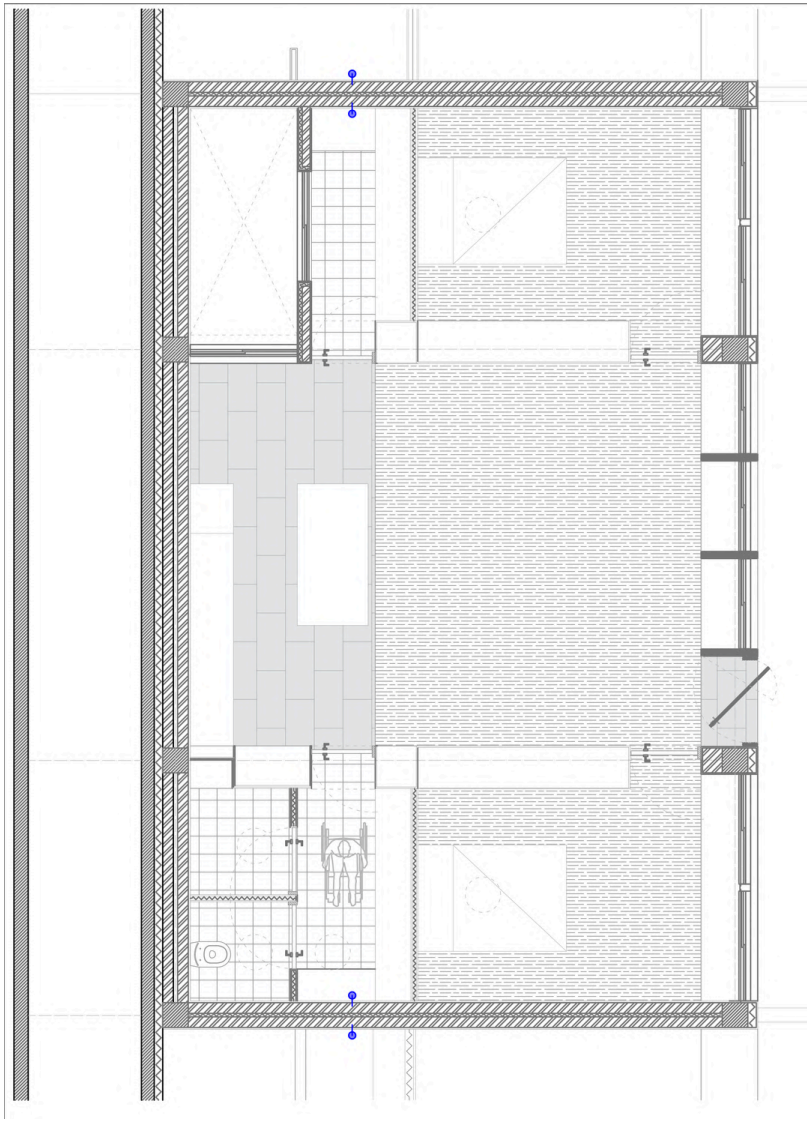

From a 16000 m2 terrain, my group decided to divide itself into two sectors, upper, not represented here, being a public gathering and commerce place, and lower for housing and public garden. I took the lower sector and advocated to integrate a wastewater treatment for irrigating the garden with rainfall and greywaters.
Only local plants and trees were considered here, using a small sized lavender present in a nearby town as the "carpet" for this hopefully zen place.

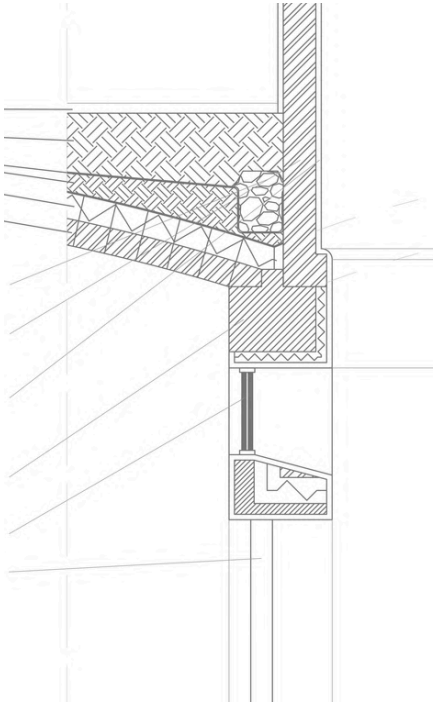

Garden

First drawing, housing complex on lower sector.
Second and third drawings, example of house. That could be converted into commerce. Only one façade to the atmosphere facing south-east.

Bench

Earthen construction research, Chaniá

Morning shot, early June,
when the bricks and the area
around the olive tree is under shade

3d scan of the finished work

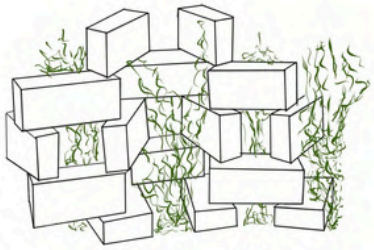

Afternoon shot, early June, when
the bricks are being heated

2024/25
Group

Sitting bench
Chaniá, Greece

5th and last year in architecture classes I did Erasmus in Crete, Greece. For the assignment of constructions with natural materials (Ειδικές κατασκευές με φυσικά υλικά), with the intent of understanding how the material works, a small and quite challenging bench was planned and made entirely out of adobe bricks, hugging an olive tree.
My role in this project was more of understanding how to make it not fall apart, its orientation and final 3D scans and modeling.

Plant Wall

Sitting area with table

Experimental model

The bench only faced one side because of the difficulty of the entire process: we opted to do the essential

Stavros lives

Group

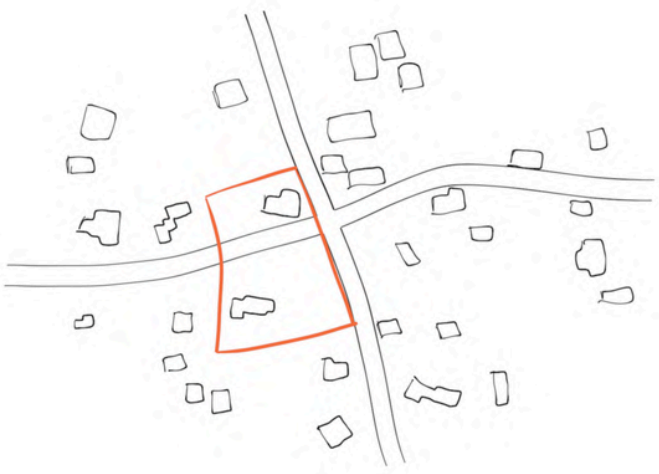

Landscape reconfiguration
Chaniá, Greece

The beach town of Stavros, Chaniá, has the problem of being abandoned during off turism seasons, and my group had to solve this issue. We intended to introduce objects into the landscape as landmarks (my colleagues' job), while also allowing for healthy and enjoyable walks between those (my job).

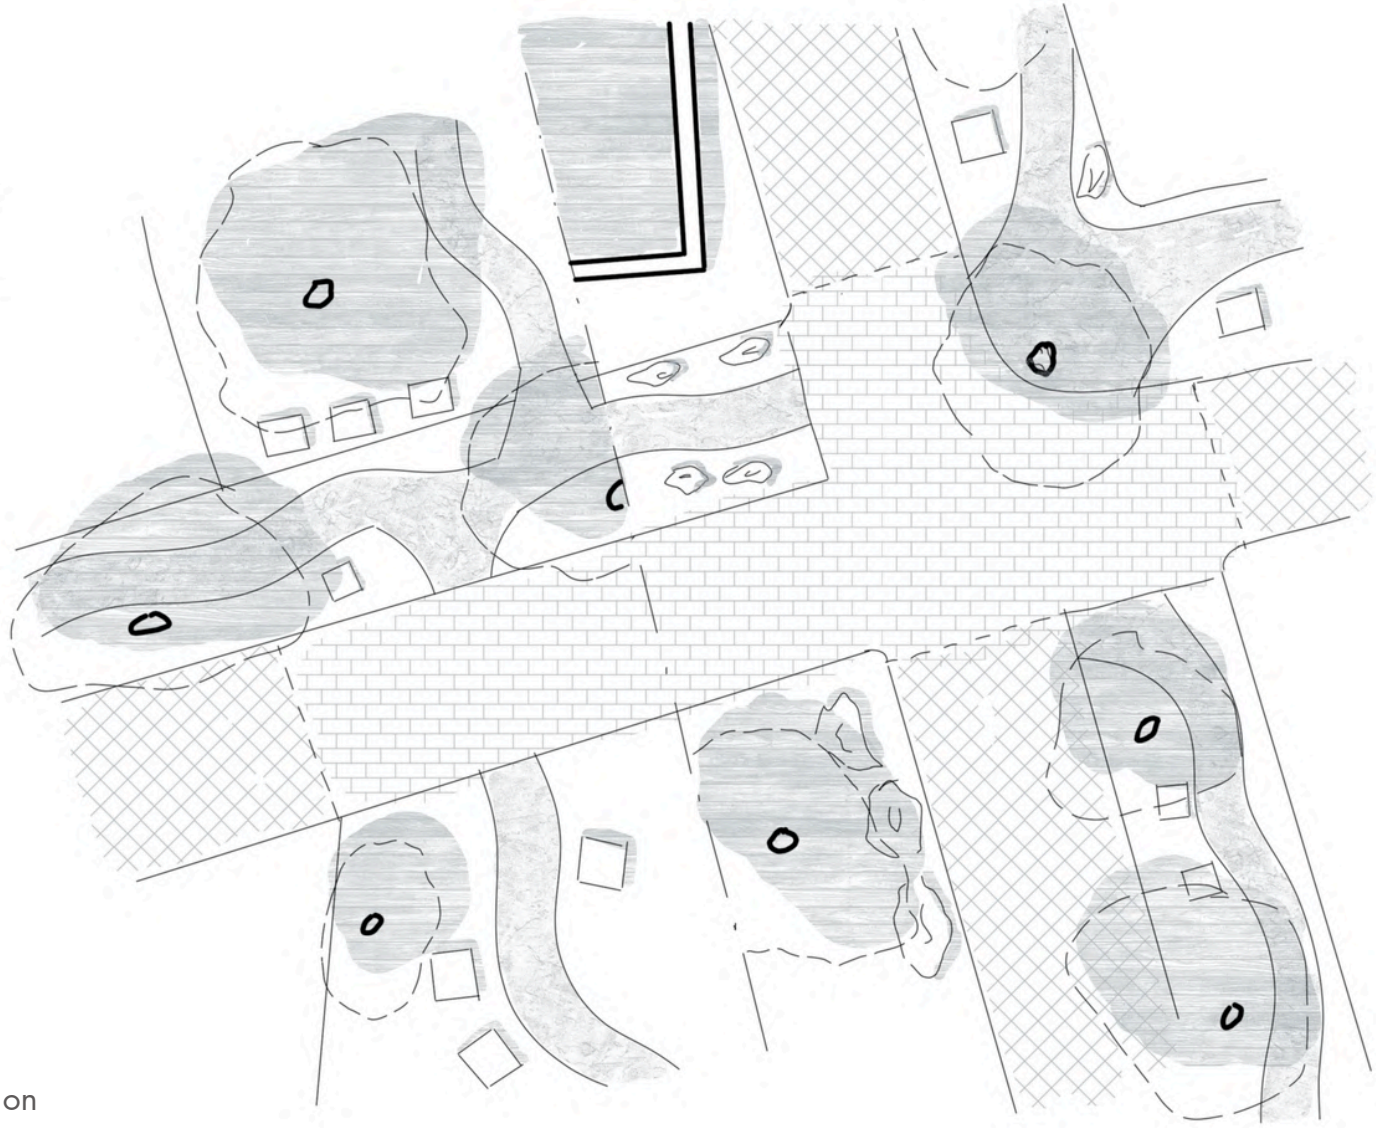

Hence, I reorganised the street network to improve pedestrian movement, including along existing unpaved roads. The proposal incorporated local, aromatic plants, whose qualities would be enhanced by the warm climate and constant sea breeze.

Vehicle and pedestrian path

Paper-work

Of personal interest

-/2025
Individual

My interest in cardboard began in middle school, when I started using it for arts and crafts. Since then, I have continued experimenting with it and, more recently, with papier-mâché and papercrete, including using these materials to make furniture for my bedroom.
The experiments shown here include:

1- First boat i made out of cardboard and hotglue;

2- First human sized (1,6m in length) boat I did. Done with papercrete and a structure of cantilevers, before knowing what and how they worked;

3- Various experiments of application of papercrete onto molds.

2

3

1'

2'

4

3'

4'

5'

This interest led me to explore the use of these materials in architectural models. Encouraged by positive feedback from some tutors, I began investigating their potential beyond model-making, particularly in construction. Paper-based materials may offer useful properties, including thermal insulation, ease of processing and recyclability.
However, I have not conducted laboratory tests to verify the thermal, acoustic or fire performance of these prototypes. Their potential therefore requires further experimental assessment.

4- Cylinder used to monitor drying during curing;

5- Maquetes, at real scale, for and housing project, being;

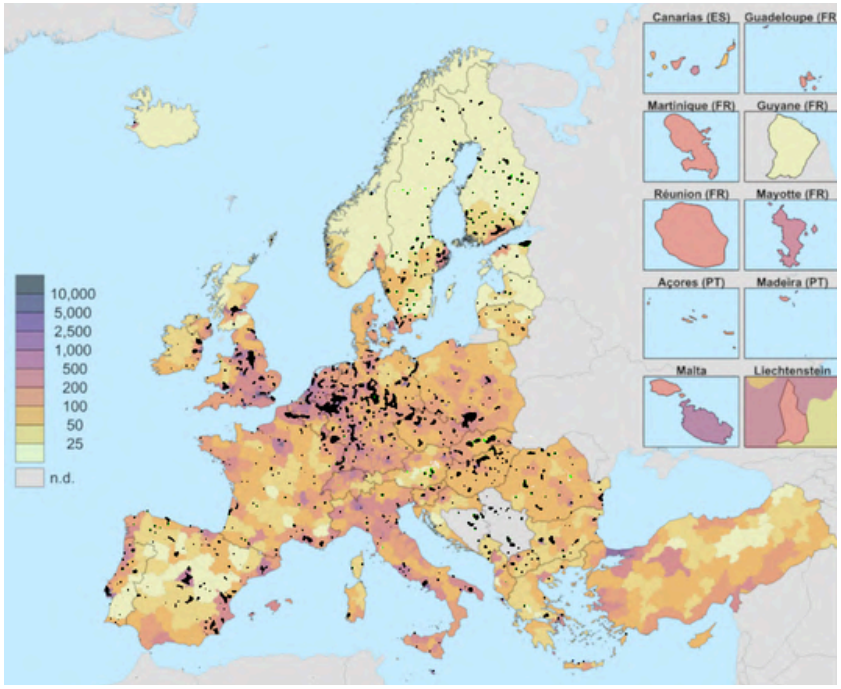

1'- slab and pavement section;
2'- wall section;
3'- pavement insulator;
4'- wall filling;
5'- reinforced plaster.

2025/26
Individual

Master Thesis (finishing...)

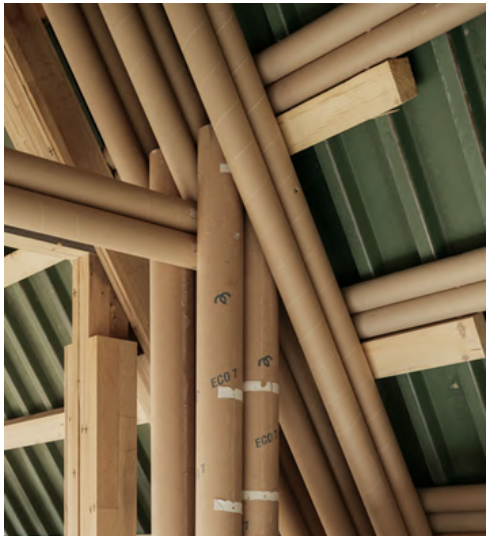

My interest in waste materials, both for model-making and potential construction applications, led me to investigate the use of municipal solid waste as a construction resource.
This thesis aims to explores the properties of such materials and architectural examples to learn and argue over “is this material feasable?”.

Landfills and population density and examples of waste implemented in architecture/building materials
