LANDSCAPE DESING

GROUP 40 - Joel Gras - André Andrade- David Romero

ANALYSIS AND FIRST PROPOSAL

In Stavros, we identified a rich variety of vegetation throughout the neighborhood, where each species plays a role in organizing, protecting, concealing, or defining the space around it.

We also observed a range of recurring forms,both natural and man-made, distributed across the area, including curves, straight lines, and more complex shapes such as circles and arches.

Juniperus

A bush with very dark leaves. Belongs to the Cupressaceae family

Texto

Eucalyptus

Tree with a presence that organizes the space around it

Texto

Texto

Acacia

A low tree with a density that grows wildly, localized on the interior

Ubicus Pervifolia

Short tree, with low presence

Pinus Pinea

Tall tree with umbrella-like appearance

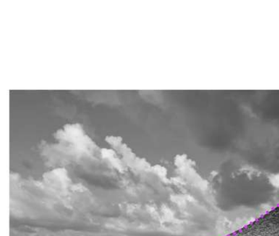

Olea Europea

Big tree with a strong presence

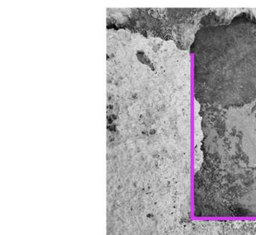

Pinus Halepensis

Medium-sized tree commonly due to the highest visible number of pines

Phoenix Canariensis

Small-sized palm trees, located next to the sea

Ercele Fiorege

Bush found along the sea coast, affected by the wind has a grey epicrnea

Nerium Oleander

Shrub-like plant with flowers, used along the perimeter of the coast line

Crassula Ovata

Brush with thick leafs that store and maintain water

Pirus Calleryana

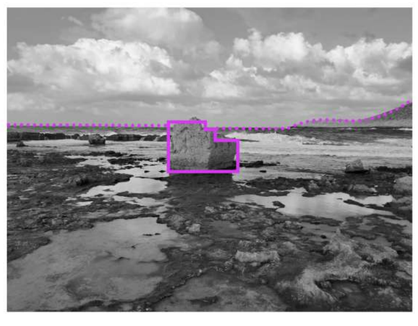

Originaly from China

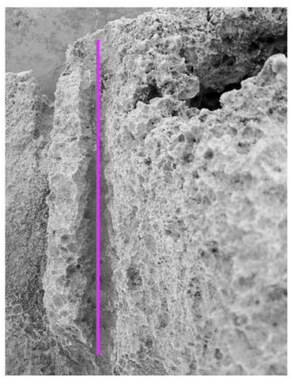

Fouquieria Splendens

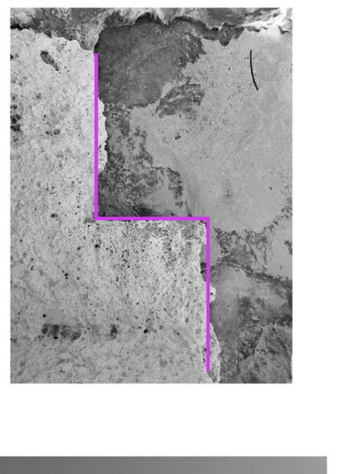

Tall tree with dry branches that produce flowers during the rainy season

The initial concept was to introduce a series of cubic elements within the identified areas, marking key landscape points.

These cubes serve as anchors within the site, complemented by a network of pathways that guide visitors through the space.

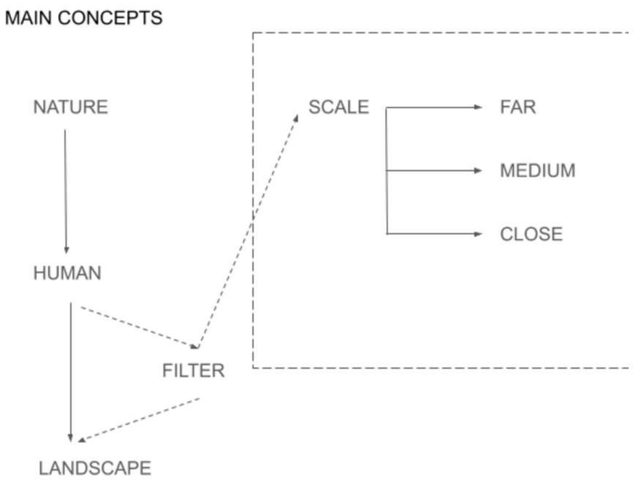

The interplay of varied vegetation further accentuates these moments, enriching the overall spatial experience.

WORKING METHOD

To generate, through natural elements and human-made constructions, spaces that enable the observation of a landscape at each of the previously mentioned scales. Additionally, through these interventions, we aim to prevent the desertification of the area during the winter months by creating a lasting attraction in the region.

NATURE

Endless connection of things, a fluid unity of becoming that is expressed in the continuity of spatial and temporal existence. Nature has no parts; it is the unity of a whole. It is not something limited solely to vegetal elements; human-made constructions are also part of this nature. Nature is everything.

HUMAN

The subject responsible for delimiting and filter a landscape by perceiving the sensations it generate, also known as nature.

LANDSCAPE

A delimitation of a set of nature produced by human sight. It is not a unity; it is a fragment, a collection of visual and emotional sensations extracted from a certain subjective delimitation.

FILTER / SCALE

Identify the filter that we, as humans, apply to the landscape. We understand the filter as the process through which the human being chooses which frame of nature to delimit.

We identify a single way of filtering: scale. Depending on the space in which you are situated, you perceive different elements. We understand scale as the relationship between size and proximity to the landscape being observed.

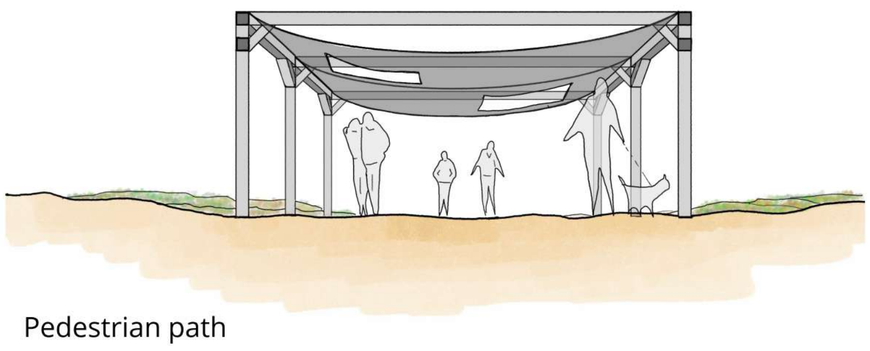

After analyzing and observing the Stavros area and considering the key points mentioned earlier, we decided to intervene through subtle actions that blend naturally with the environment—especially with the sand. These minimal interventions create specific points of interest that guide visitors to engage more deeply with their surroundings. In addition, we propose a connection between all these points through a reconfiguration of the road network. This improved circulation enhances the overall experience and leads to a central focal point: the market, which serves as a vibrant hub and gathering space for both locals and visitors

CONNECTIONS INSIDE STAVROS

Example of redesign of street
Scale 1:100

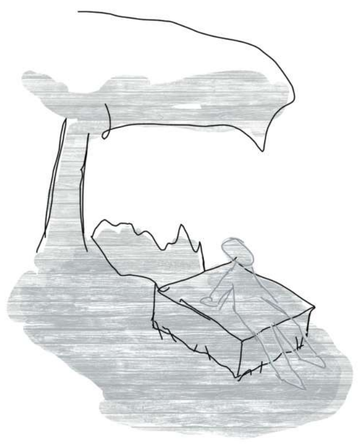

Bidirectional

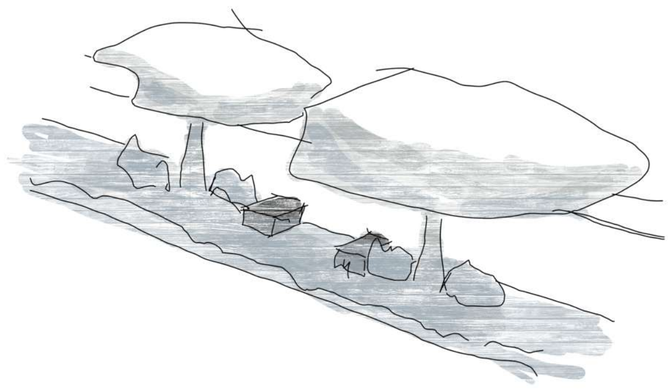

Unidirectional

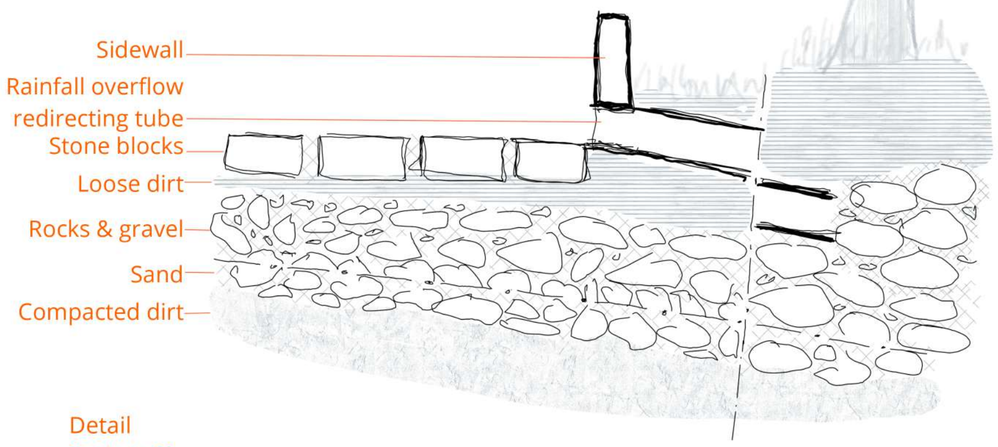

Unidirectional tracks follow a counter clockwise direction

To connect between the landmarks, allowing a more comfortable walk, a redesign of the streets is necessary. Without side walks, nor space for those, half of the width of the entire track is allocated for vehicle use, being one directional, being the rest for pedestrians only.
Because of the extreme weather Σταυρος has, heat regulation is considered, being achived with shading, by the use of vegetation such as trees and bushes, placed across the pedestrian track area.

As for resting places, cube-like sitting places would be placed allong the pedestrian areas, always reminding the user of the Quarry with itś unique shaped stones.

Detail
Scale 1:20

Tilia

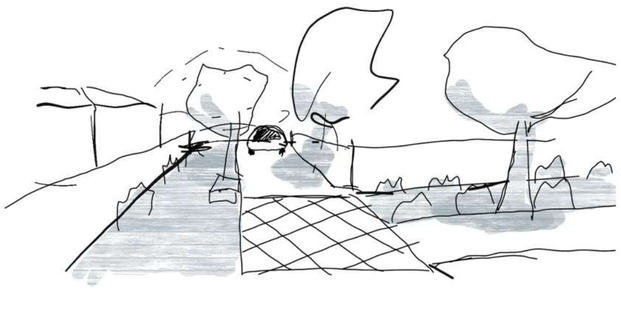

Pinus Pinea

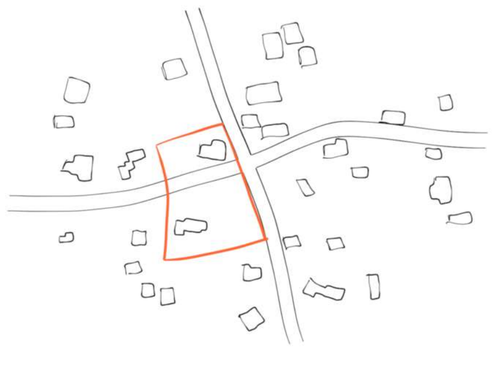

Citrus Limon & Sinensis

Is advised using different types of trees that do not disturb too much the local flora , but at the same time provide shading, nice smells and fruit if possible, such examples as Tiliae, Pine trees and Lemon/Orange trees could be nice additions to this streets.

This design allows a pourous pavement, while being capable of storing water between rocks and gravel for the vegetation, that doubles as structural base. Compacteddirt works as the primary base and as a non perfect water barrier, conducting most of it to the nearby tree's roots, but also allowing some to infiltrate downwards

Since there are two houses, apparently, abandoned, and being in a central cross in Σταυρος, this area is now adapted to a local meeting point, not being defined already if garden, plaza or other type. At least, the northern building should be preserved, transformed into a public or private type of service for this town. To connect northen and southern sections of this park, the path reserved for vehicles only, will accomodate pedestrians as well, being represented this shared uses by different patterns and mateirals on the pavement.
