Contents

Highschool
2016-2019

University 2019-2026 (?)

Academic education:

Bachelor and (soon) Master degrees in Architecture
University of Beira Interior 2019/2026

Erasmus Exchange
Politechnical University of Crete 2024/2025

For software useful for architecture, I **have knowledge** in:
Autocad,
GIMP, Photoshop & Affinity,
Sketchup.

Lesser knowledge in:
Illustrator and Indesign,
Kdenlive and Premiere,
Freecad,
Qgis.

Aiming to properly learn:
Revit,
Blender,
Python.

Competitions:

MoonCampchallenge 2018/2019
Luiz Conceição 2022
One Day Design 2023

Something about me:

Love naval affairs, like model construction (yet i'm a learning apprentice), sanely interested in Architecture - have to admit that the fact of requiring knowledge in a wide variety of fields (historical, engineering, art) amuses me - also interested in FOSS software for design and architecture-related editing.

Small apprenticeship at Architecture studio
Urbitraço, Covilhã (march - april 2026)

Worked in the retail industry for 2 summers.

Helped my father and his friends in building houses.

Lunar Crystal

Encampment, Moon

The Lunar Crystal

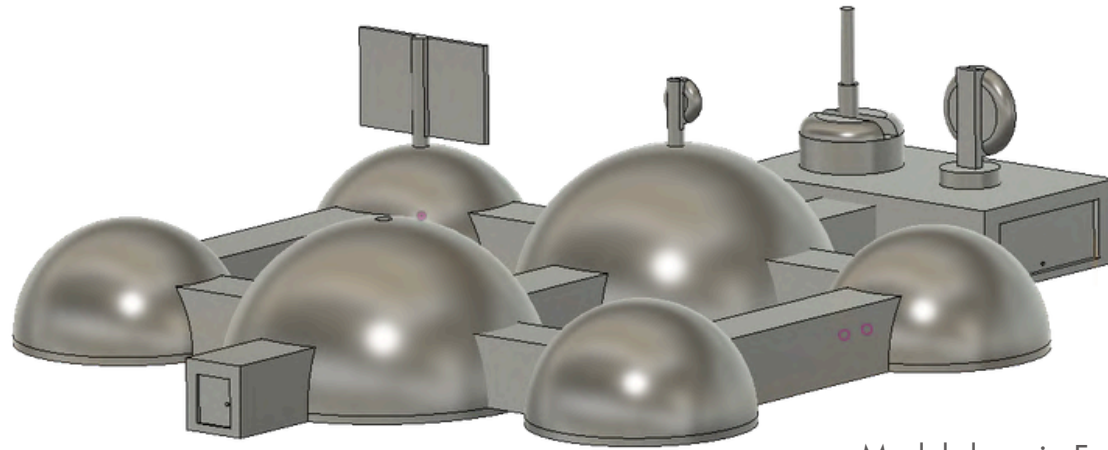

2018/19
Group

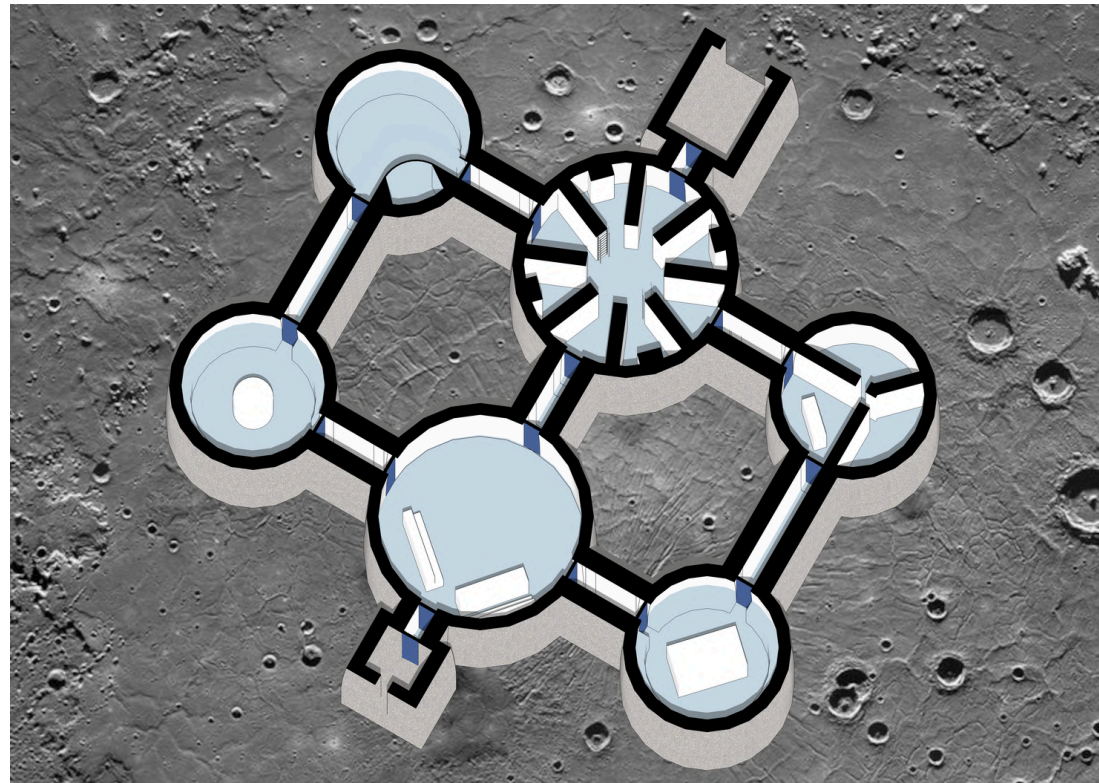

MoonCampChallenge Fundão, but for the Moon

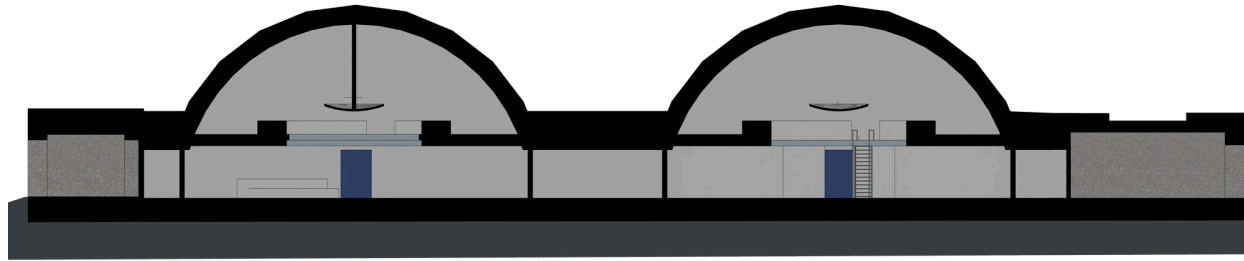

While in secondary/high school, the challenge to design an encampment on the moon, coming from ESA (European Space Agency) was propoused to my group in Physics assignment. We didn't have knoledge on about anything, but tried our best to deliver a nice product. I got the role on first sketches and modeling on the required software, Fusion 360, while another member decided to try his ideas on 3d modeling on a different program, since he had more knowledge on modeling on Catia. At the delivery day we didn't had the model on the required Fusion's file, and we only got an honorary certificate of participation.

Military perspective
done in Sketchup

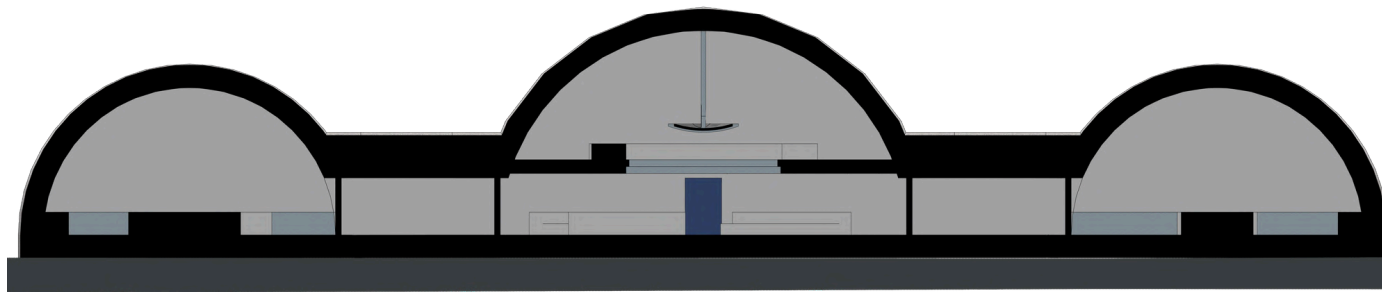

Model done in Fusion 360

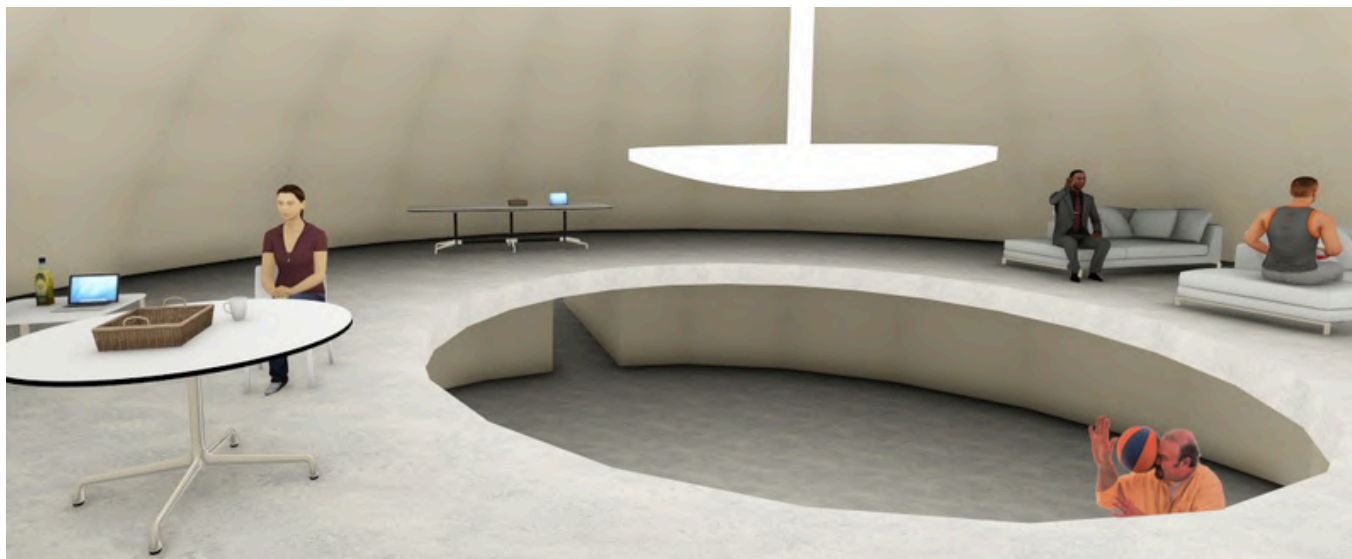

Sections of connecting modules

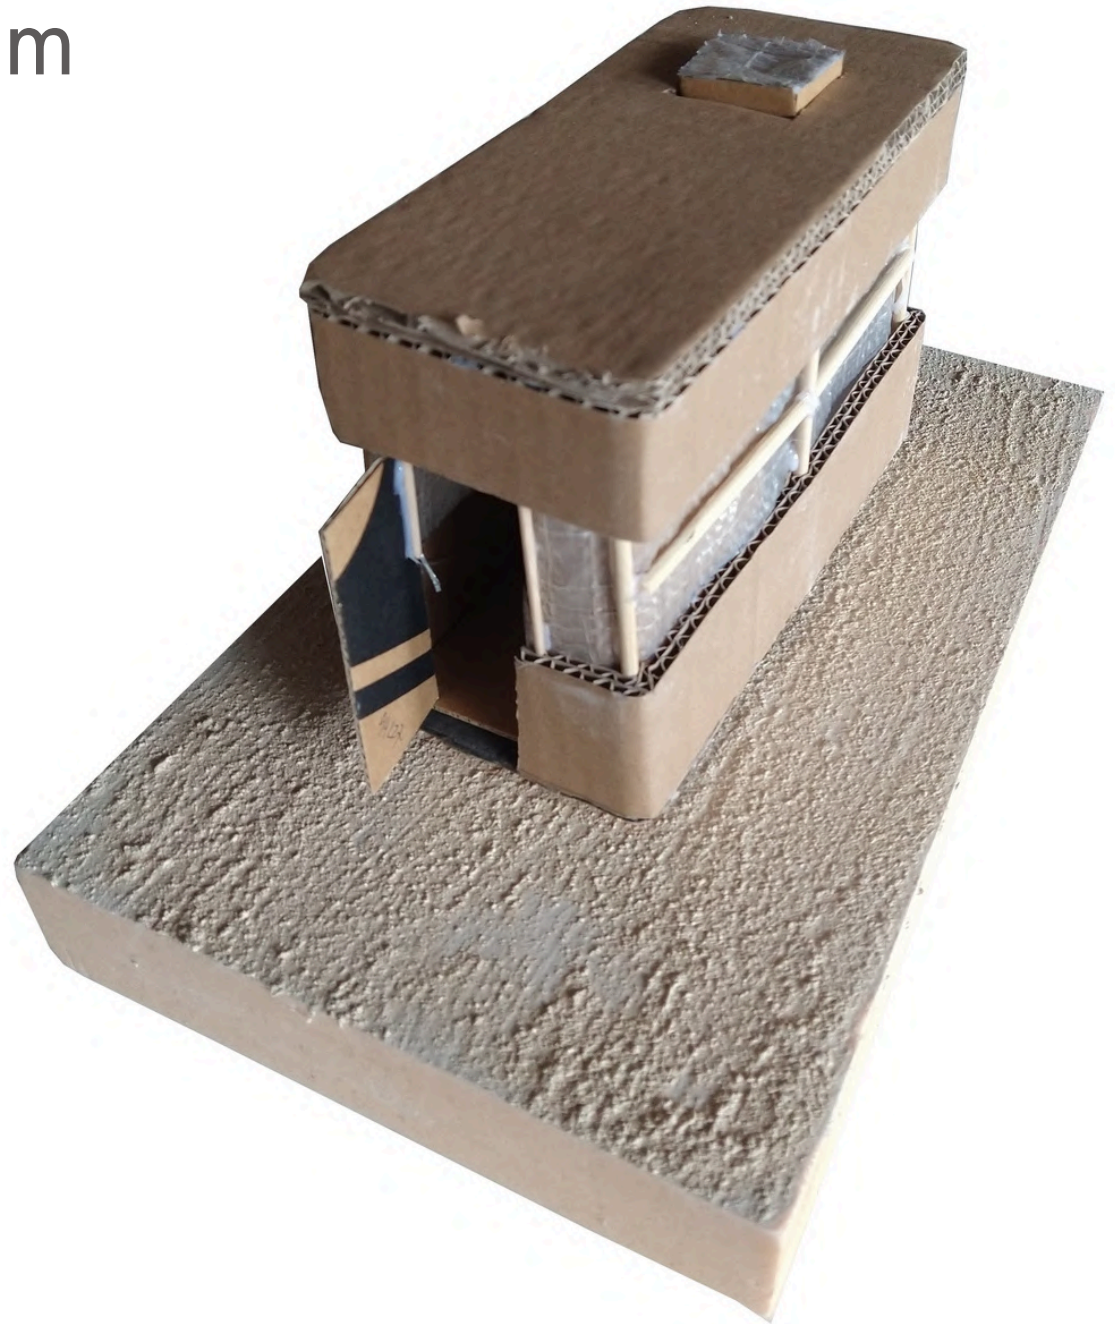

This project was meant to be modular, being constructed one module at a time, utilizing lunar regolith, allowing for more crew and more elaborated social living over its construction expansion. At its peak, would have modules for living, sleeping, hygiene/medical care, computational and chemical laboratories, also having a garage for rovers. Proved to be a simple introduction to a method for further projects.

Photomontage of the living module

Ad Vitam Aeternam

Artist lodging, Morille

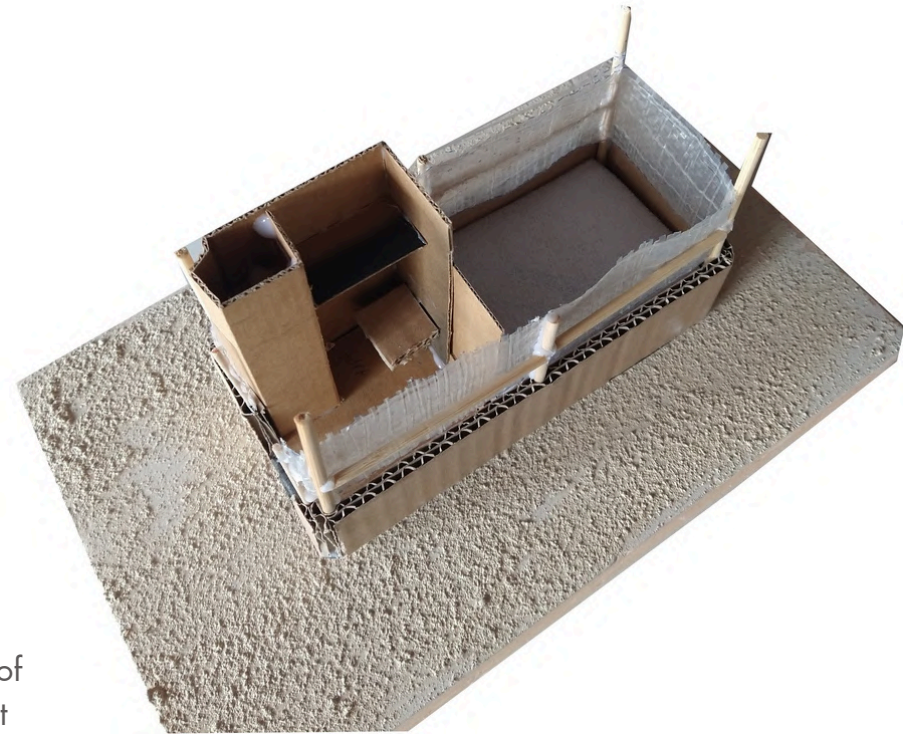

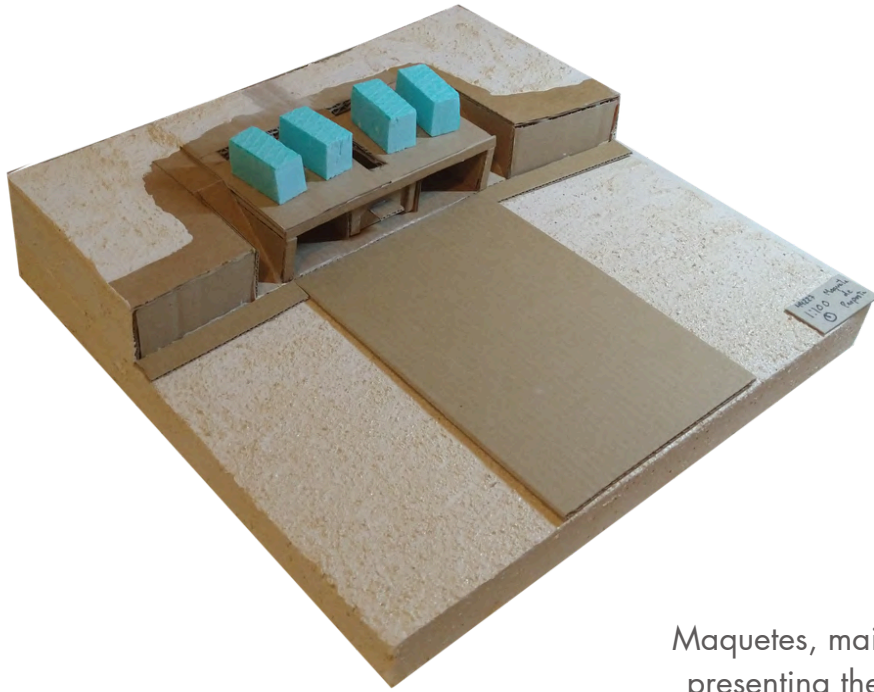

2020/21
individual

Artist Lodging/'Shirne'
Morille, España

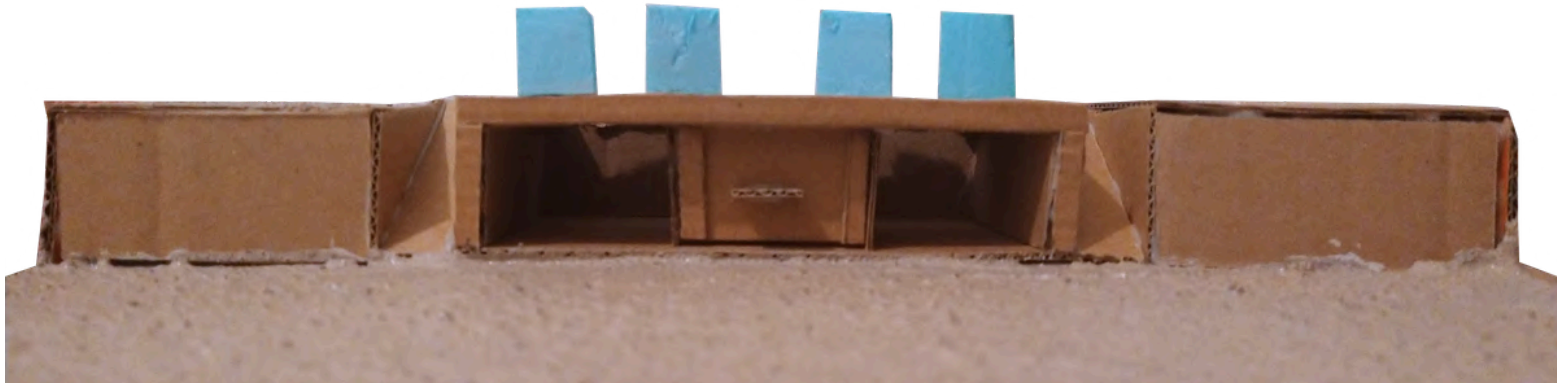

This project was conducted on the small village of Morille, where art is buried in an extensive grave. This remembered me of tales of ancient celtiberian rituals, megaliths and its monumentality. I aimed to create a ritual place, on a small scale, with the necessary lodging for 4 separate artists, utilizing the present cabins on the spot, past country's frontiers cabins, to foster the graving act (the artist has to feel like of the frontier between life and death).

Imagined ritual of depositing art, uniting various
different forms of art to praise human creations

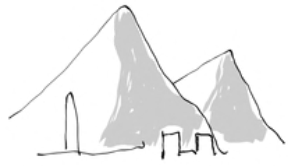

Maquettes, main way of
presenting the project

Casa Criar

Art creating housing, Covilhã

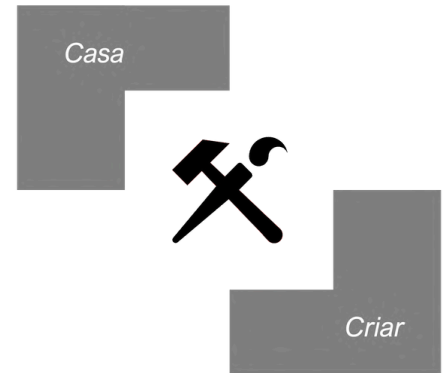

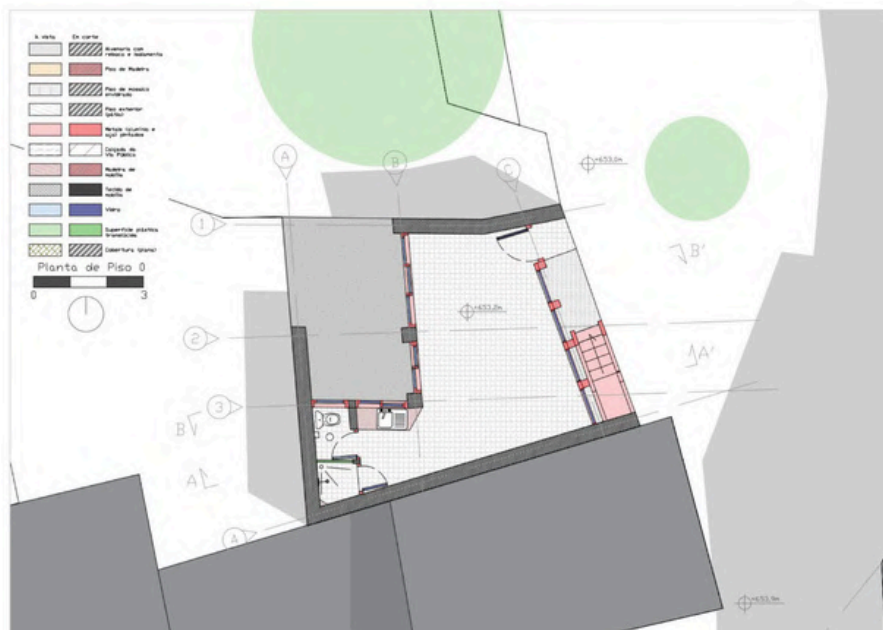

2021/22
individual

Artist Lodging Covilhã, Portugal

Located on a uninhabited street, this project was aimed to bring life to the public space. Meant to lodge 2 artists temporary, this volume was drawn in such a way that, while allowing for living and working places separately, both can be connected visually through the mezzanine that is the living room.

My first proper approach to renders. I focused more in orthogonal views than perspectives, giving headaches to teachers that demanded only AutoCAD drawings, to evaluate my work. My grade wasn't a headache afterwards.

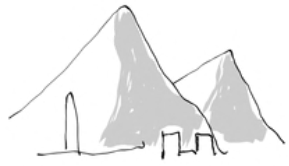

EduBridge

Educational facility, Covilhã

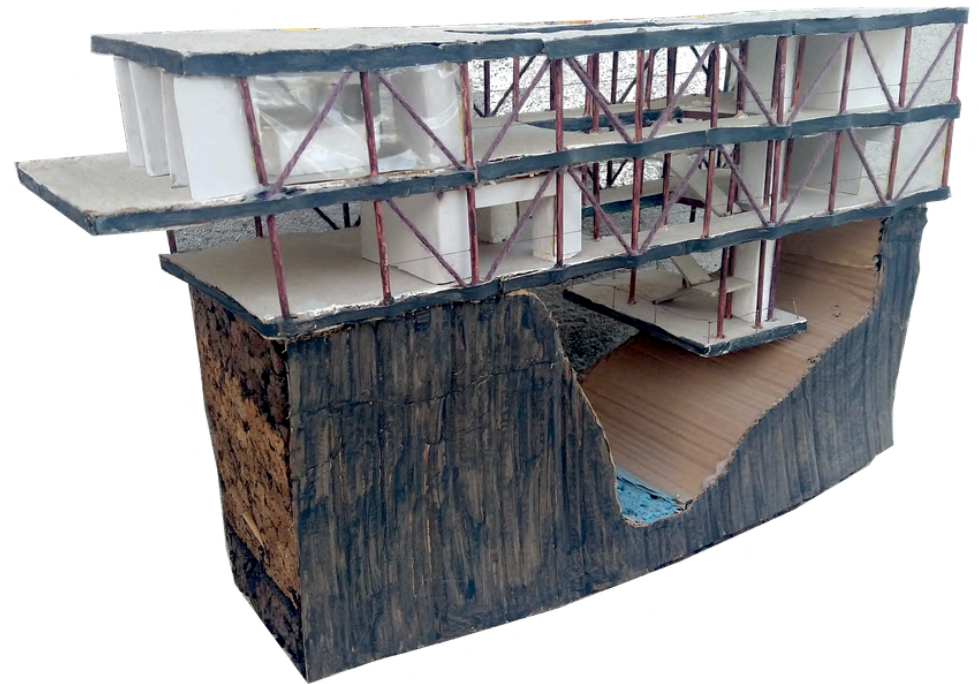

2021/22
individual

Educational Bridge Covilhã, Portugal

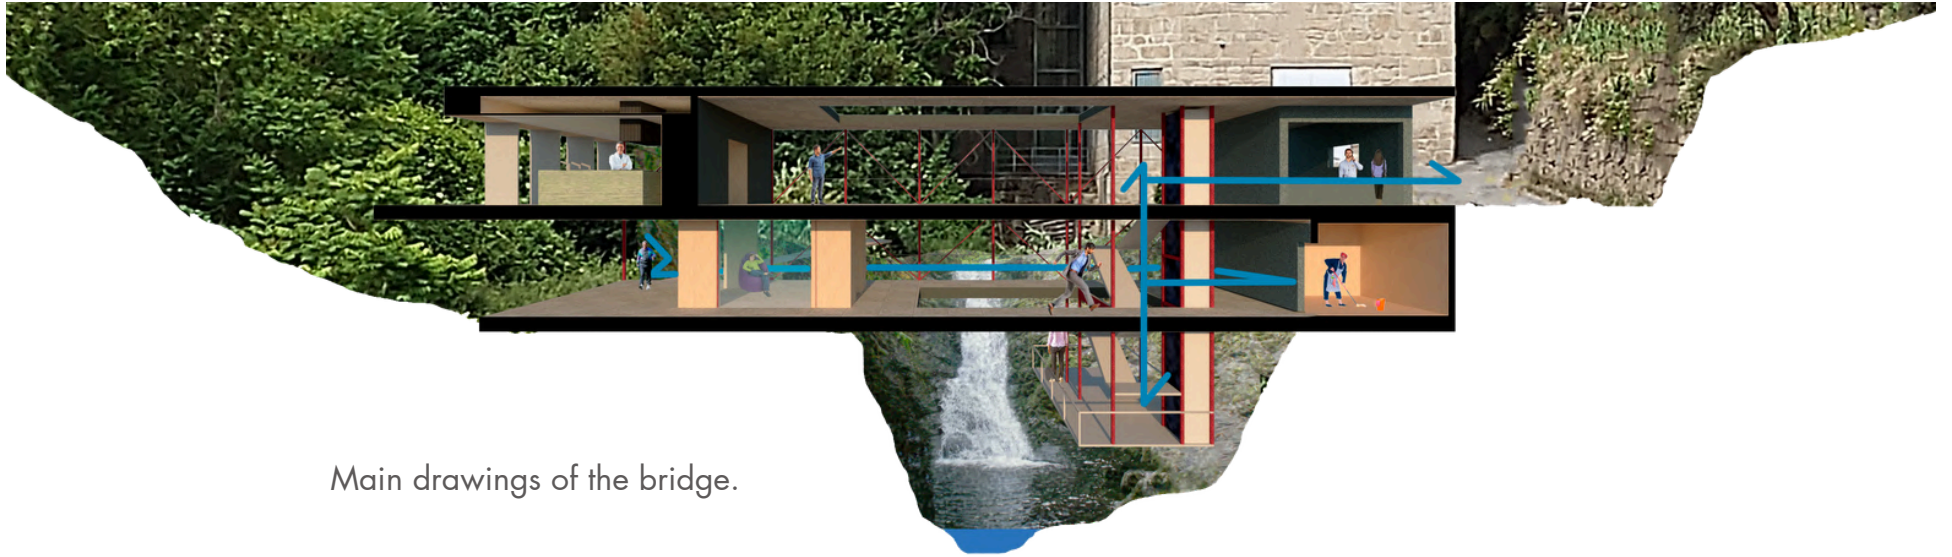

Challenged by Museu dos Lanifícios, part of my home university for an educational centre for youths to learn on this museum's theme, wool history on Covilhã. I intended to answer by solve another issue many architects tried on this town before: accessibility. That's why i've chosen a bridge-like structure, to allow access to different museum's areas, while at the same time allowing the minimal occupation of soil (and nice view down the valley).

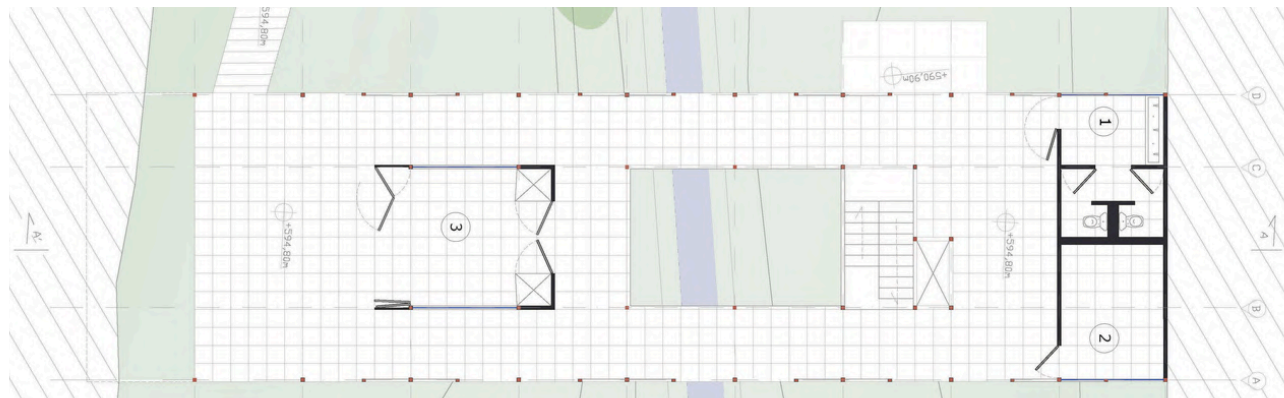

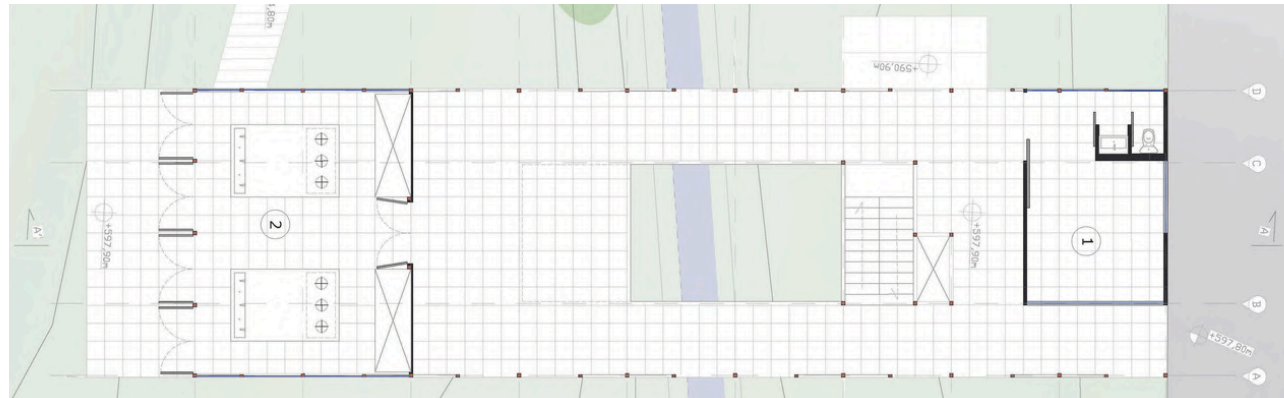

Final maquetes

Wool inking laboratory

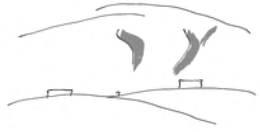

Main drawings of the bridge.

Socially coliving

Social housing & coliving lodging, Fundão

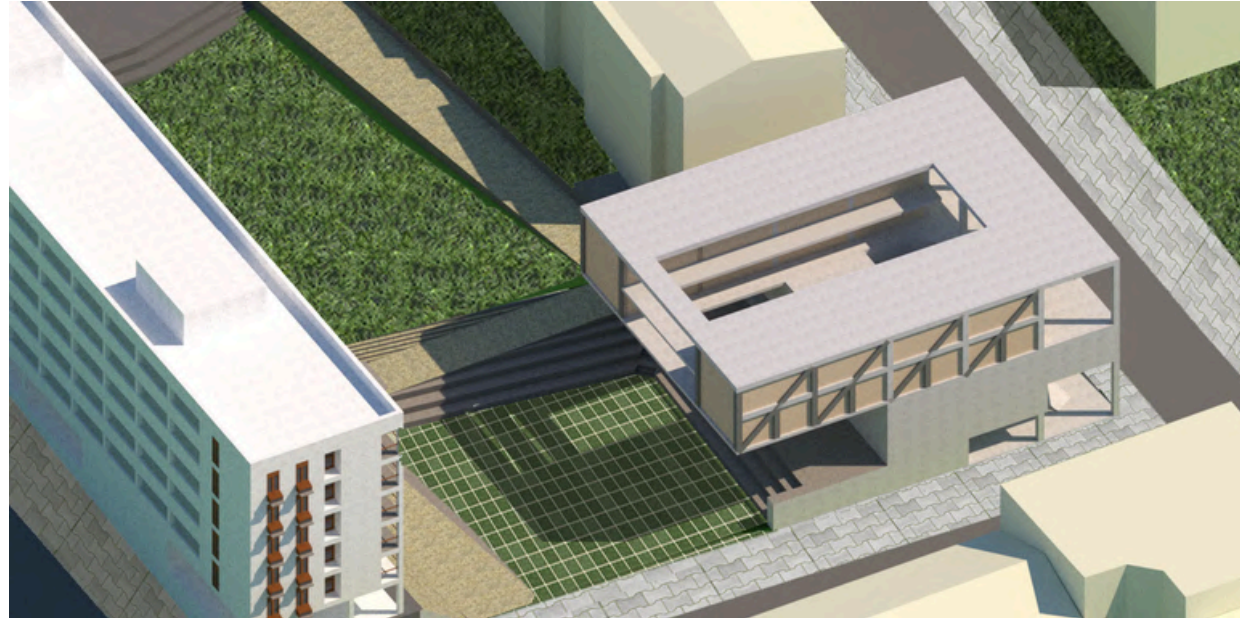

2022/23
individual

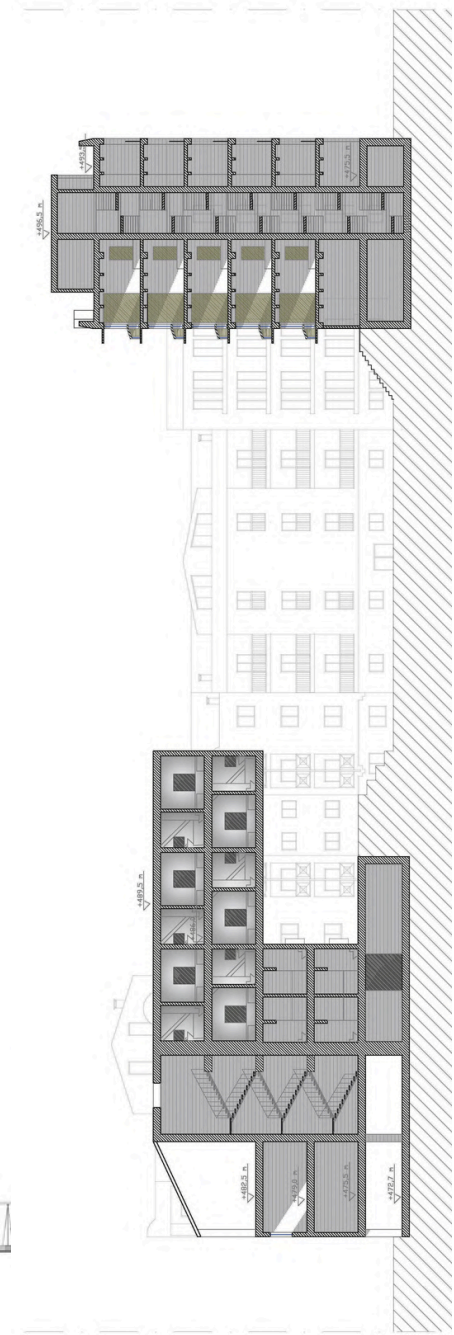

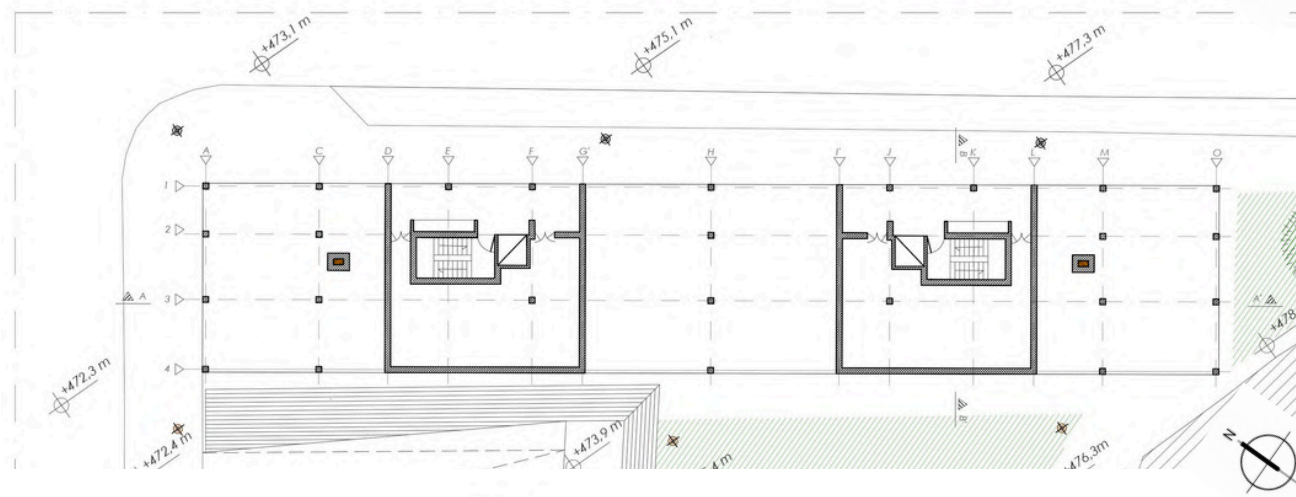

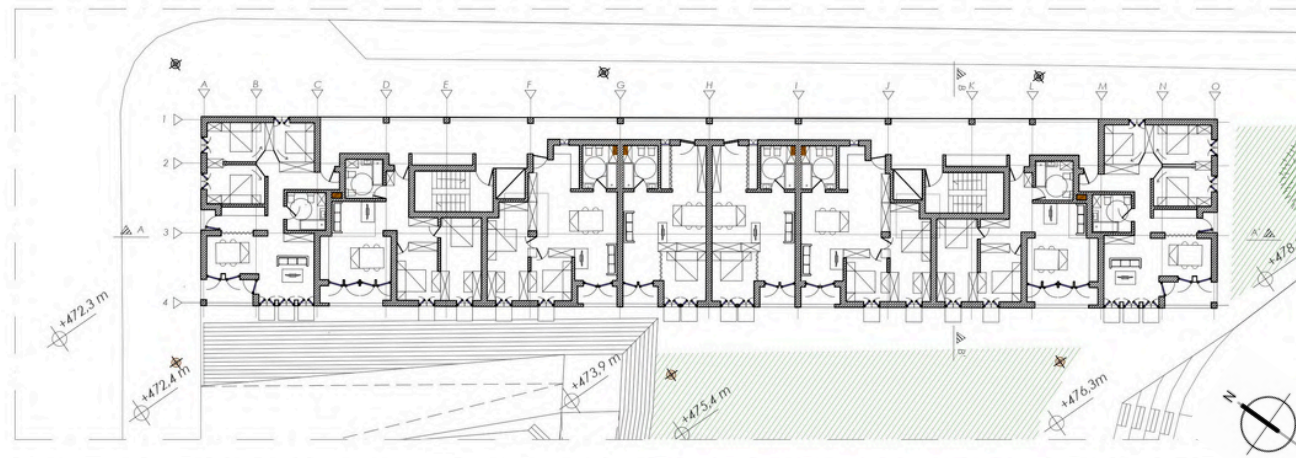

Social Housing & coliving Fundão, Portugal

Fundão is a small town, currently attracting newcomers to boost its population. We were required 2 complexes: social housing and ephemeral housing for immigrants/people in need of a roof. The social housing is a big block to allow a barrier from this area to the municipal cemetery, allowing also a closing of the plaza. As for the ephemeral lodging, the idea was of providing distancing between occupants and street walkers, while being at the same time a shading object for the plaza, since summers in Fundão often surpass 40°C. Since winters reach below 0°C, I thought a good thermal mass and insulator would be a nice implementation, proposing papercrete (more on this material in last chapter).

Torre de (Ho)menagem

Gathering landmark, Trancoso

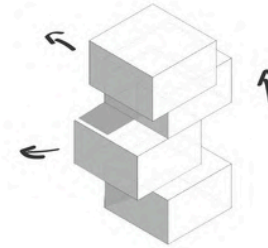

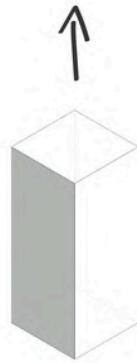

Sectioned perspectives of the tower

2023/24
Group

Cultural gathering places
Trancoso, Portugal

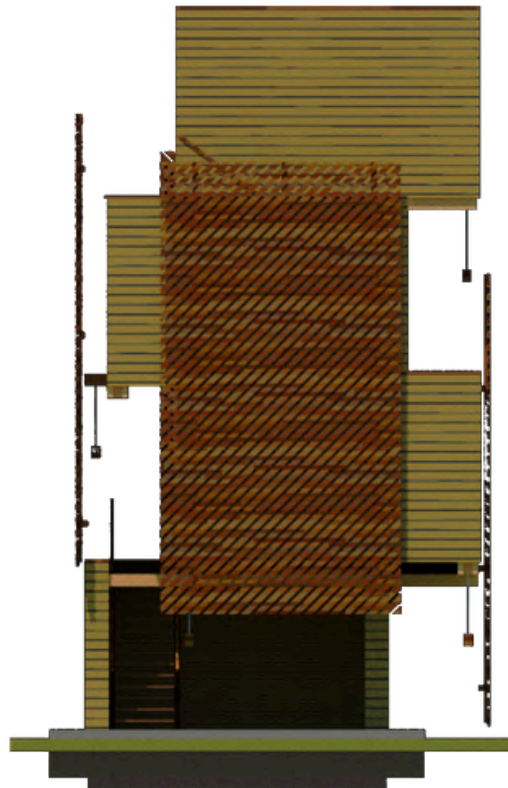

Thought process

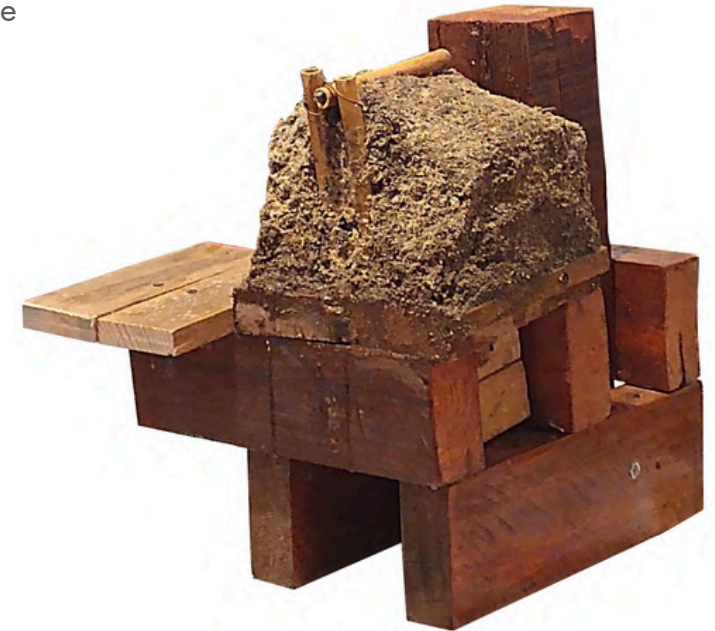

As a first approach to a town not yet well known, a tower made out of wood and dirt was implemented inside the elliptical castle of Trancoso.

For this tower, I did almost everything, since i convinced the teacher to do the tower in dirt, something my colleagues didn't want at all, hence tried their most to not collaborate, unless in front of the teacher (like $\frac{1}{4}$ of the work done).

Thankfully the teacher got interested and intervened quite often on our work and discussions, leading the project to a nice port.

Façade

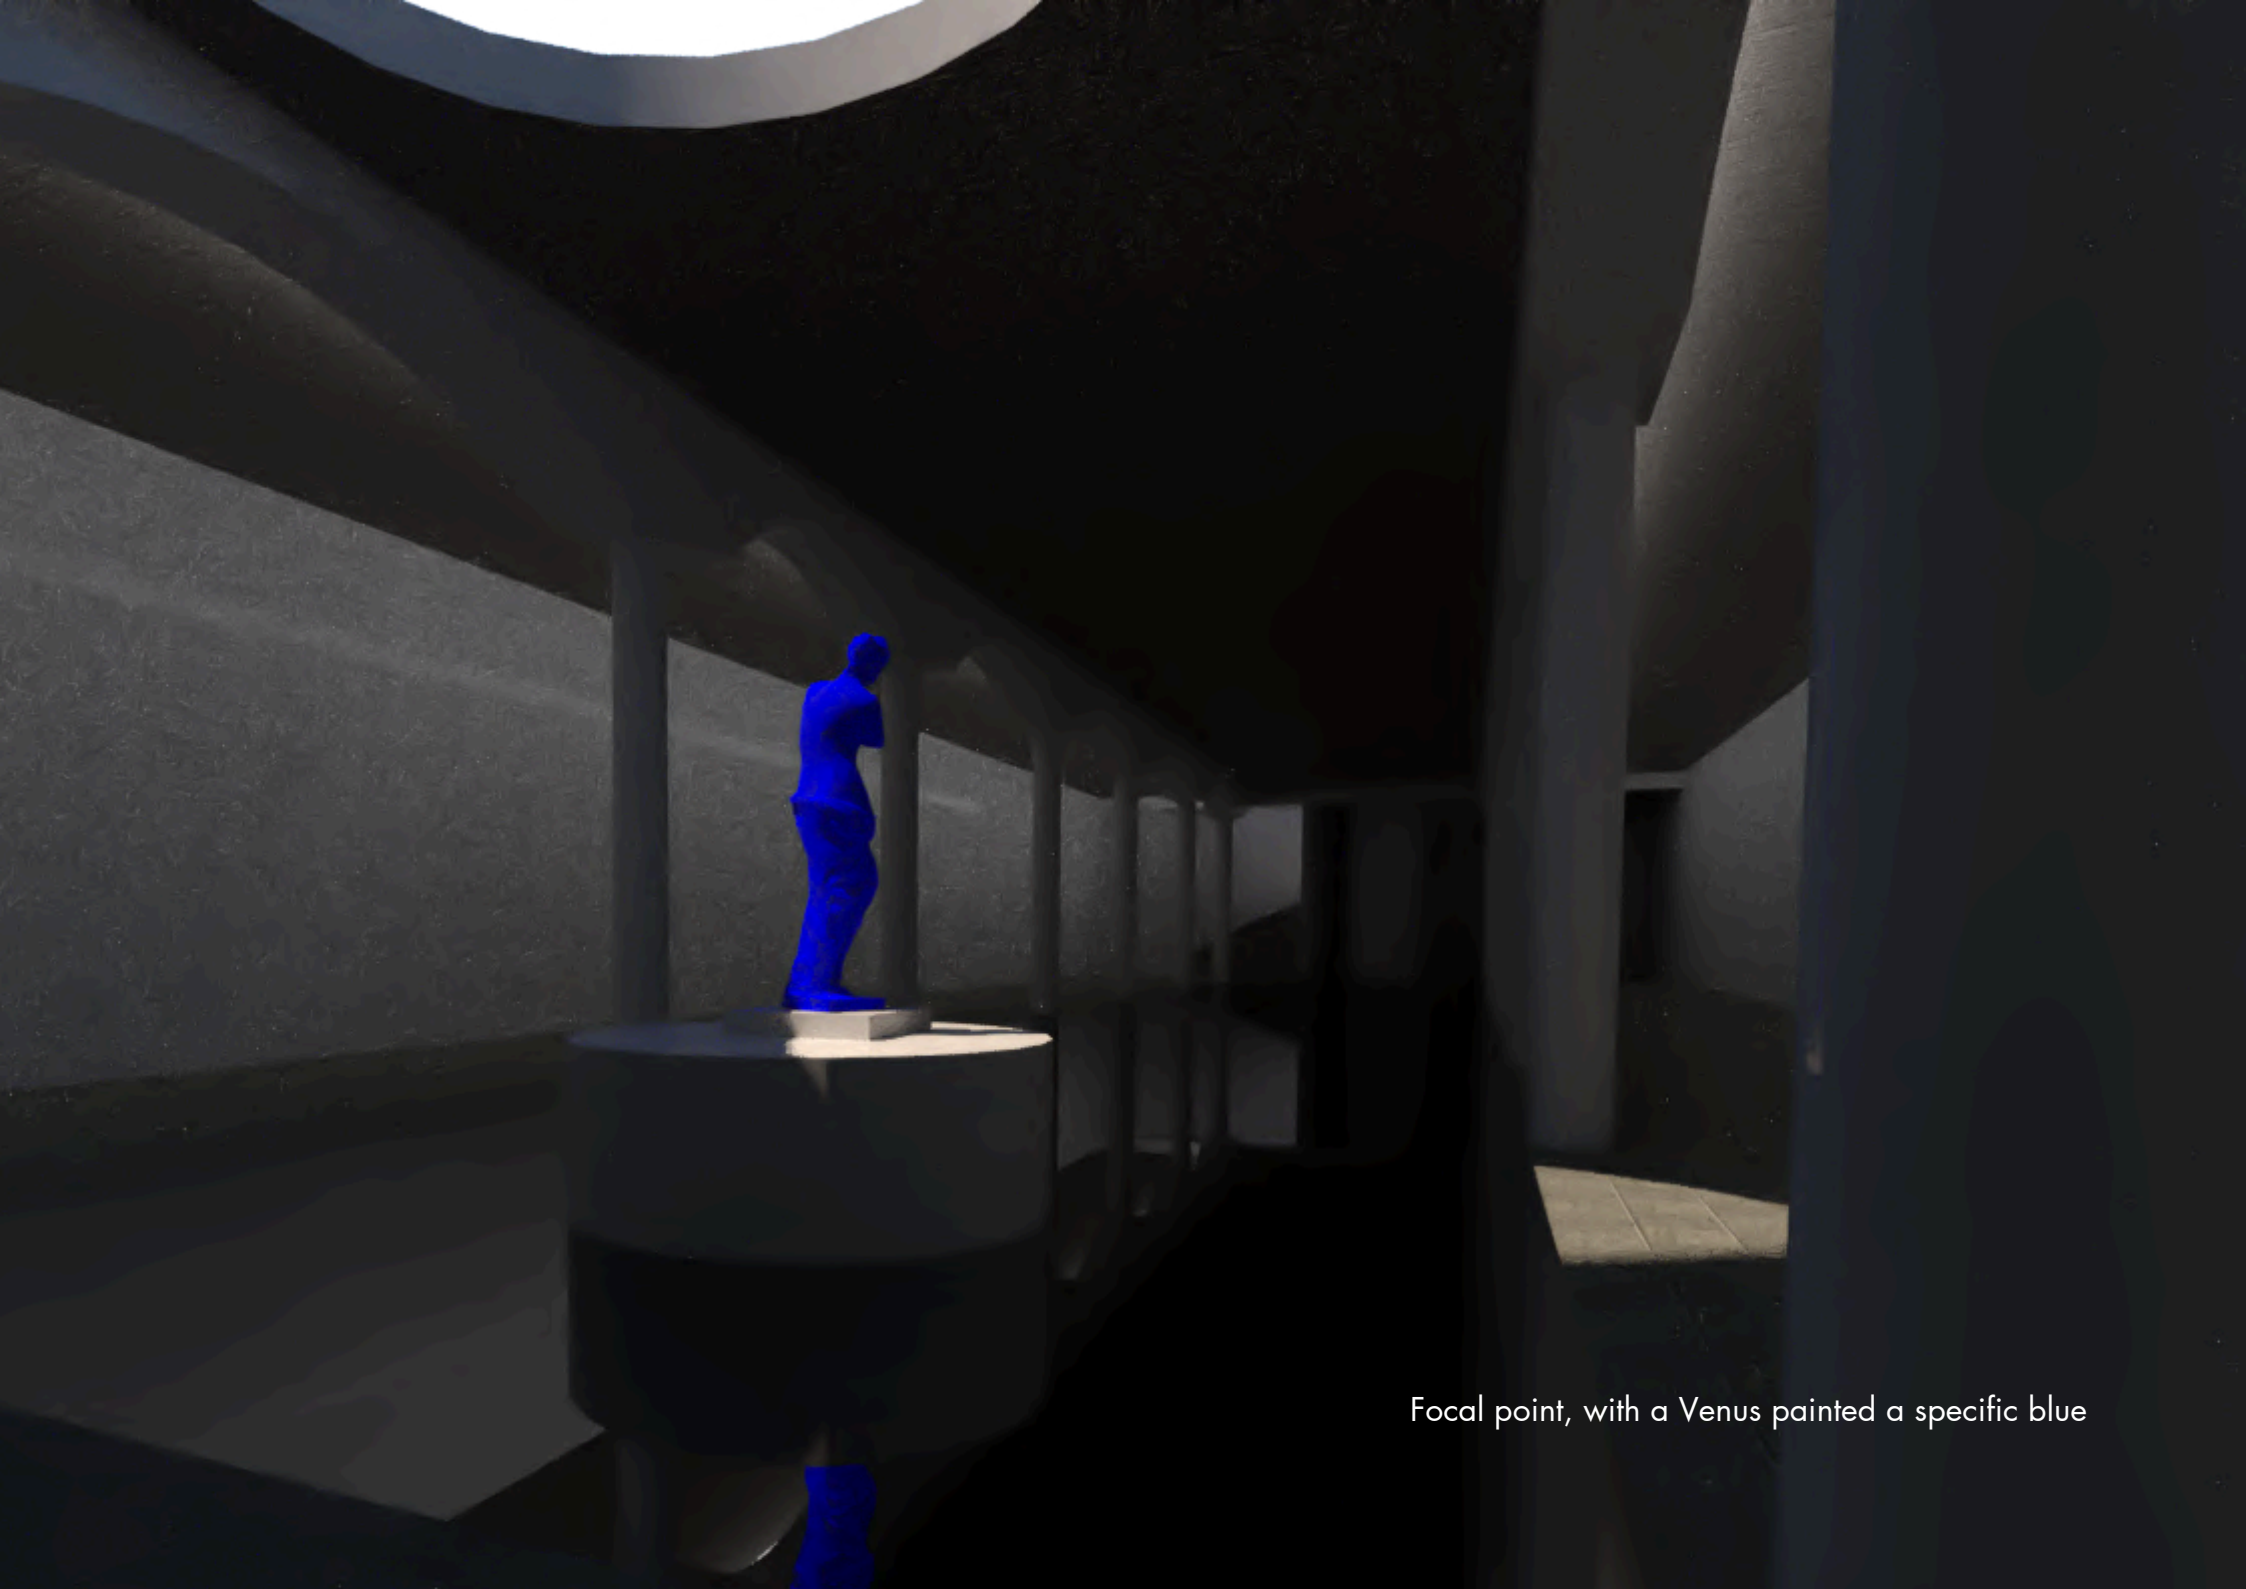

Nodal maquete with wood structure and
reeds' reinforced rammed earth wall

Underground

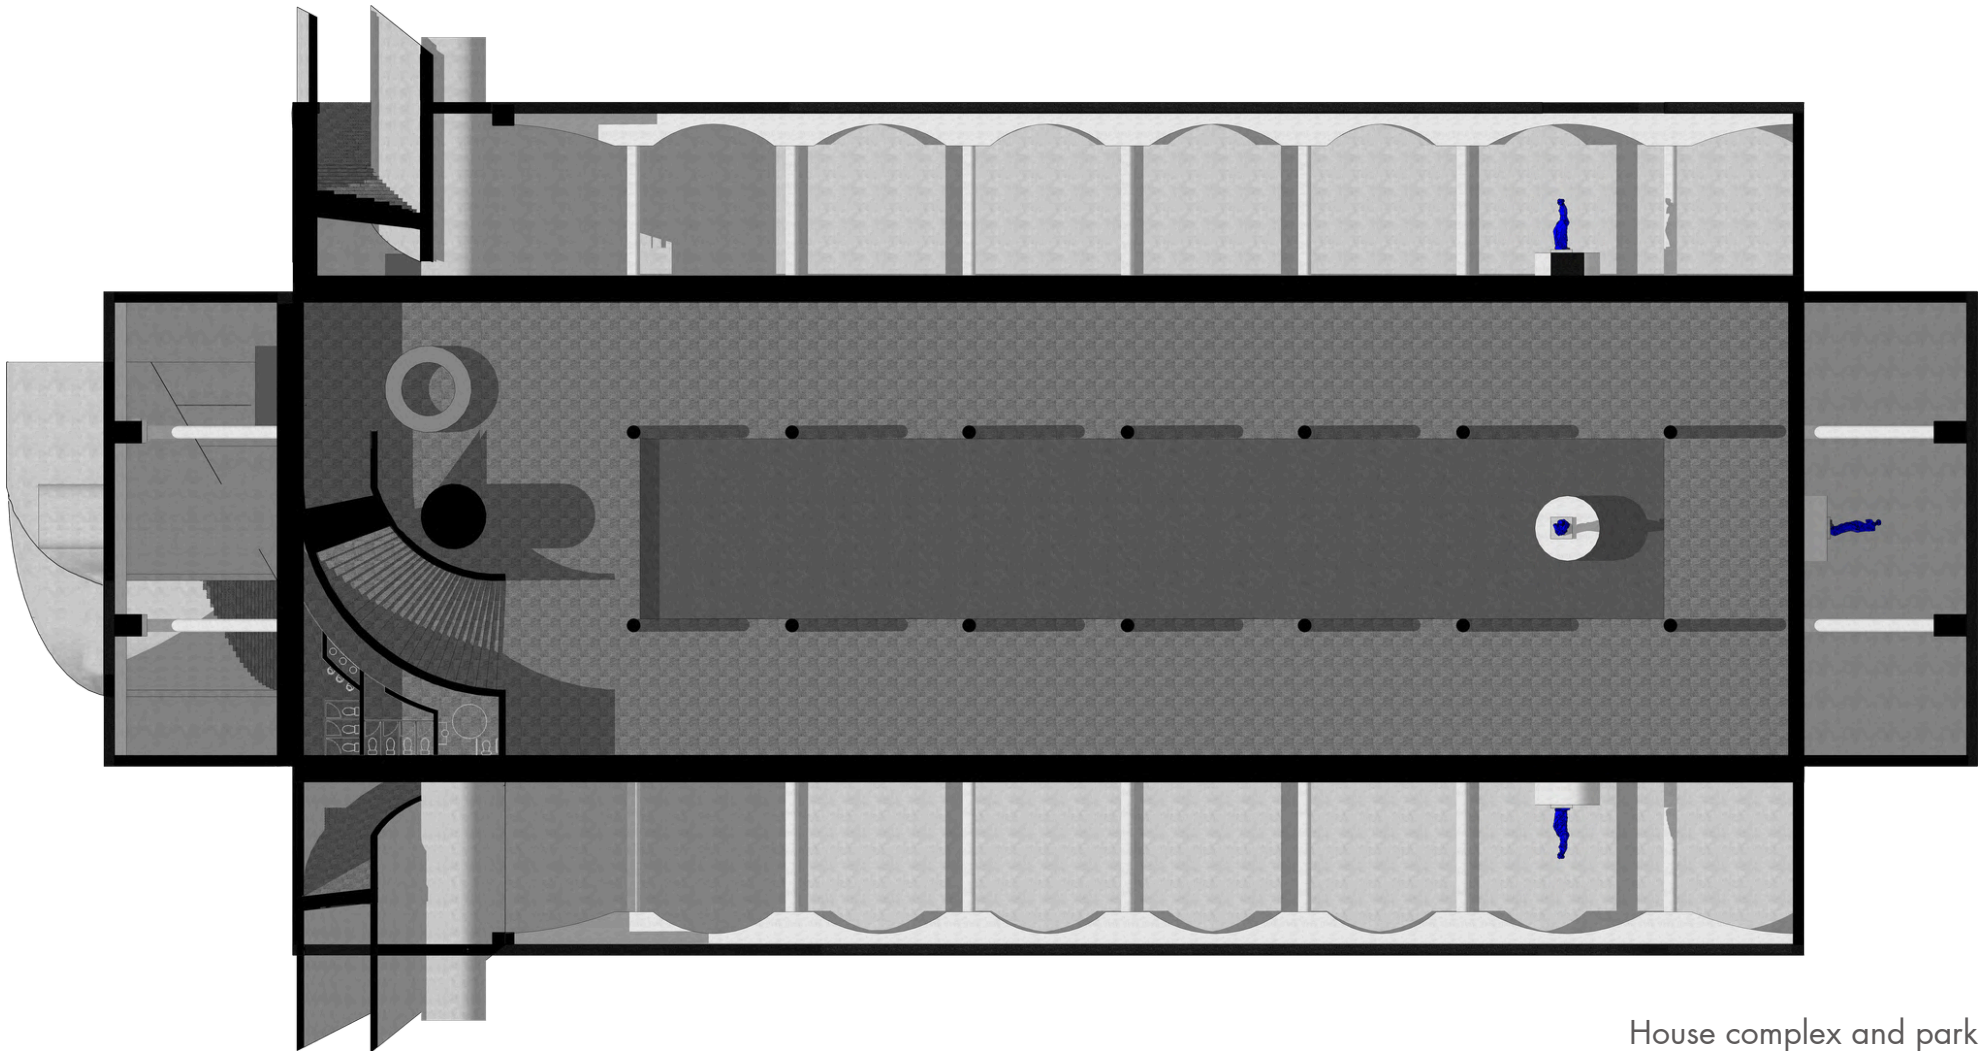

Art gallery, Trancoso

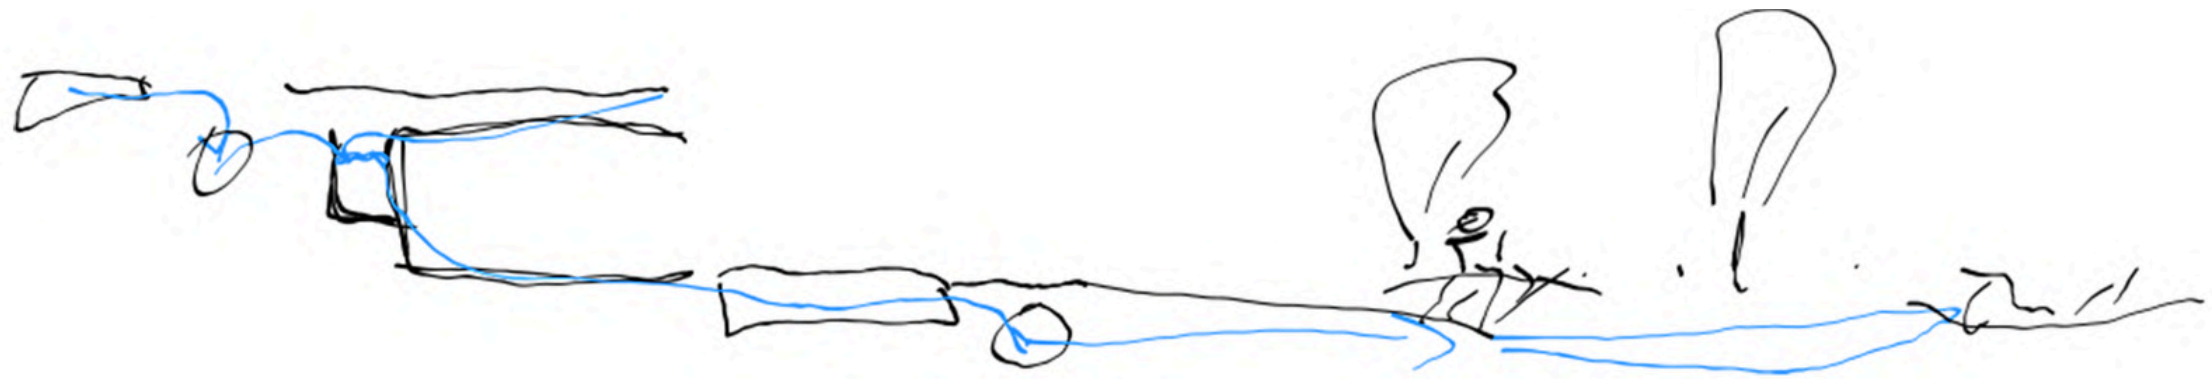

Focal point, with a Venus painted a specific blue

After knowing the town, the place to intervene, and after a first project for the place, a subterranean art gallery was developed. On this project I only did renderings and the render-like sections, since working almost alone on the first one gave me the same grade as the other group's elements.

House complex and park

Human&H₂O

Water path diagram, from rain and household, filtered on the private house soil, the conducted the the lower lake

Small urban planning, Trancoso

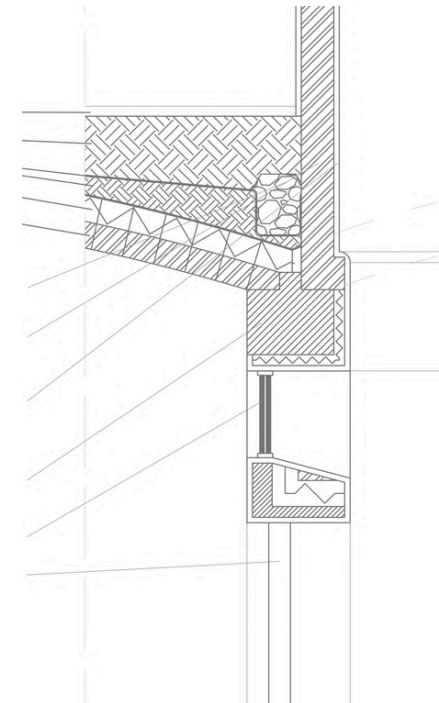

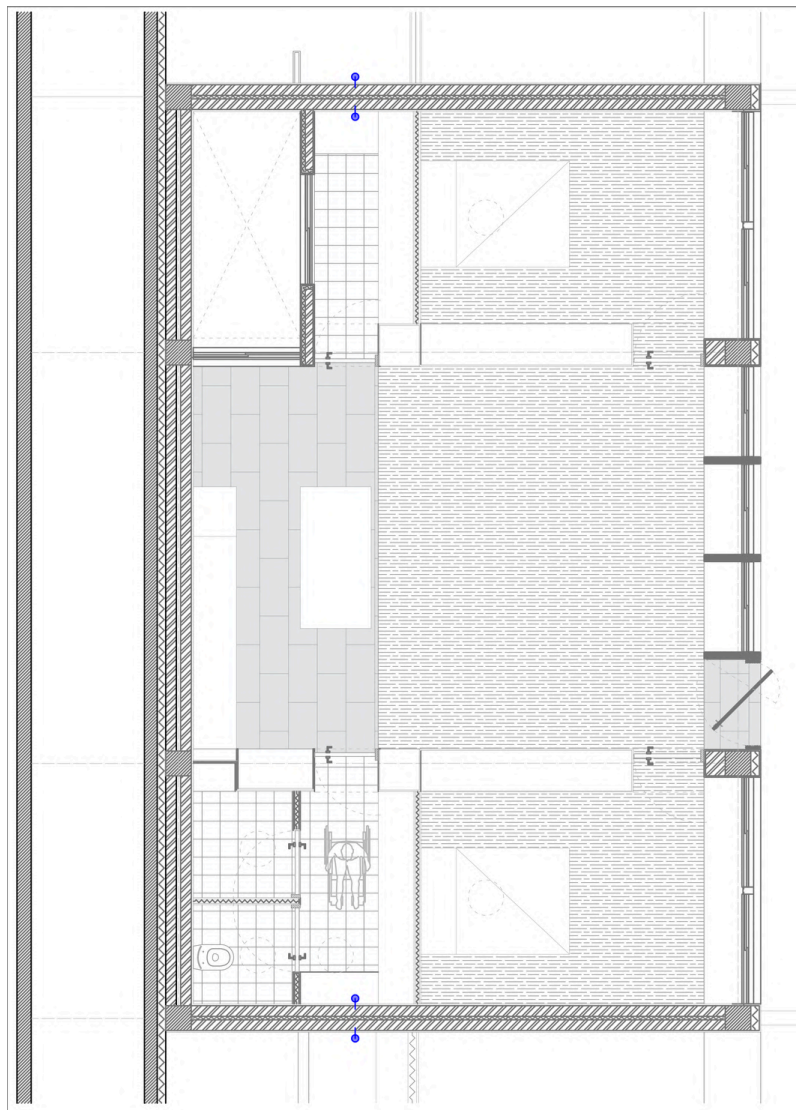

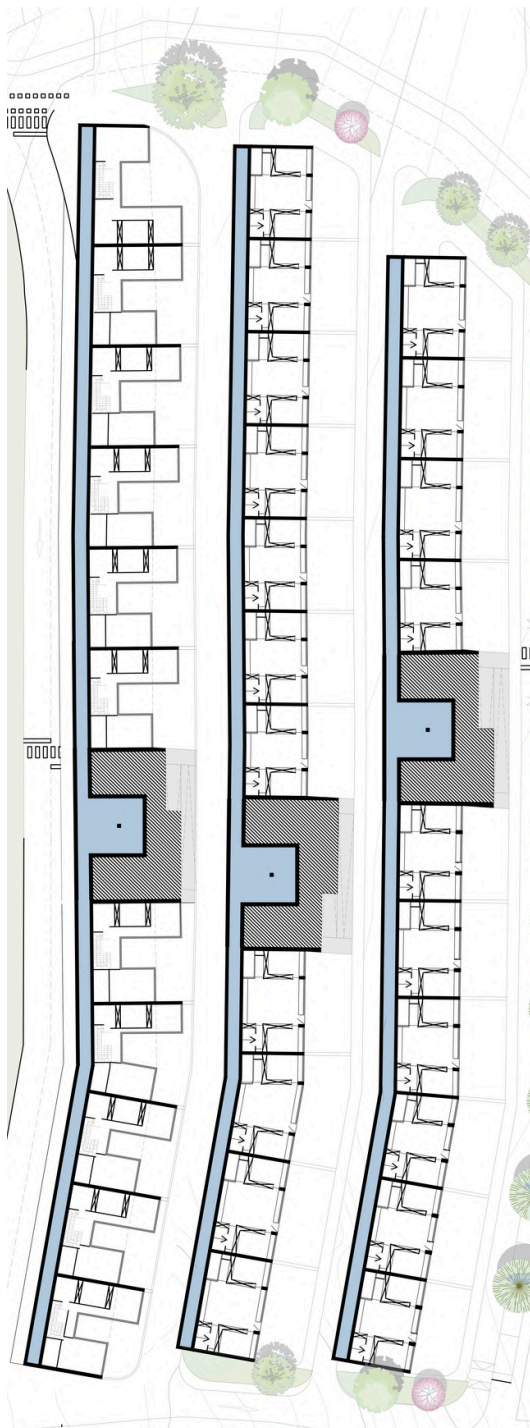

2023/24
Individual

Residential Housing and Urban Planning Trancoso, Portugal

From a 16000 m² terrain, my group decided to divide itself into two sectors, upper, not represented here, being a public gathering and commerce place, and lower for housing and public garden. I took the lower sector and advocated to integrate a waste water treatment for irrigating the garden with rainfall and gray waters. Only local plants and trees were considered here, using a small sized lavender present in a nearby town as the "carpet" for this hopefully zen place.

Garden

First drawing, housing complex on lower sector.
 Second and third drawings, example of house. That could be converted into
 commerce. Only one façade to the atmosphere facing south-east.

Bench

Earthen construction

the bricks are being heated

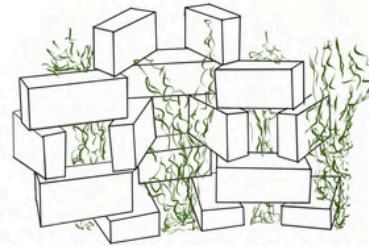

2024/25
Group

Sitting bench Chaniá, Greece

5th and last year in architecture classes i did Erasmus in Crete, Greece. For the assignment of constructions with natural materials (Ειδικές κατασκευές με φυσικά υλικά), with the intent of understanding how the material works, a small and quite challenging bench was planned and made entirely out of adobe bricks, hugging an olive tree. My role in this project was more of understanding how to make it not fall apart, its orientation and final 3d scans and modeling.

Plant Wall

Sitting area with table

Experimental model

The bench only faced one side because of the difficulty of the entire process: we opted to do the essential

Stavros lives

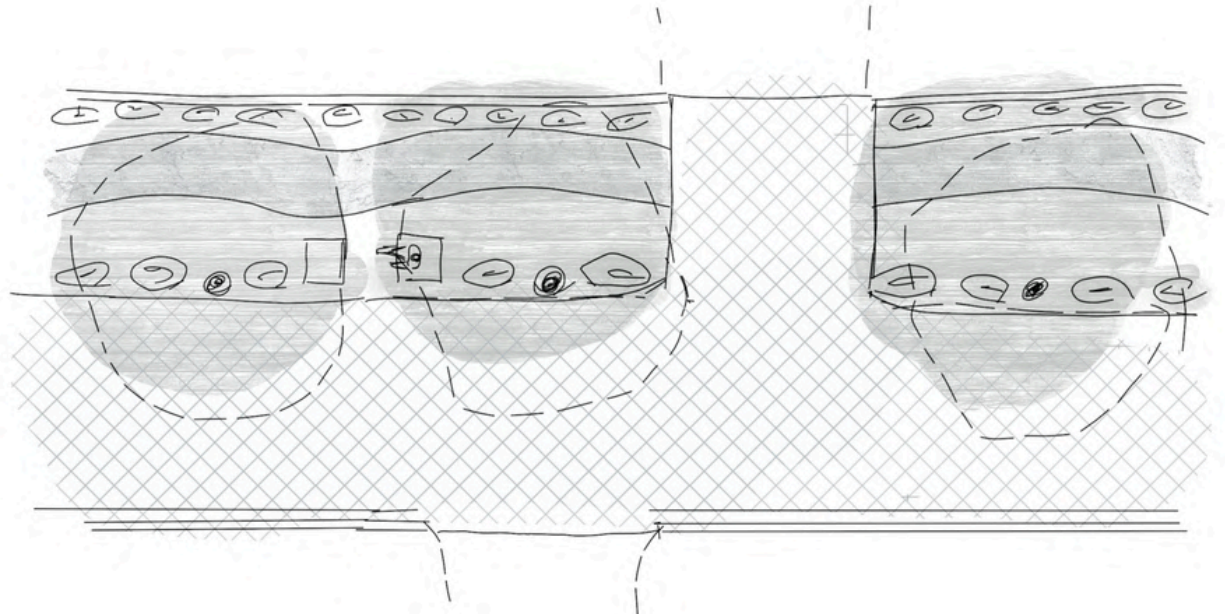

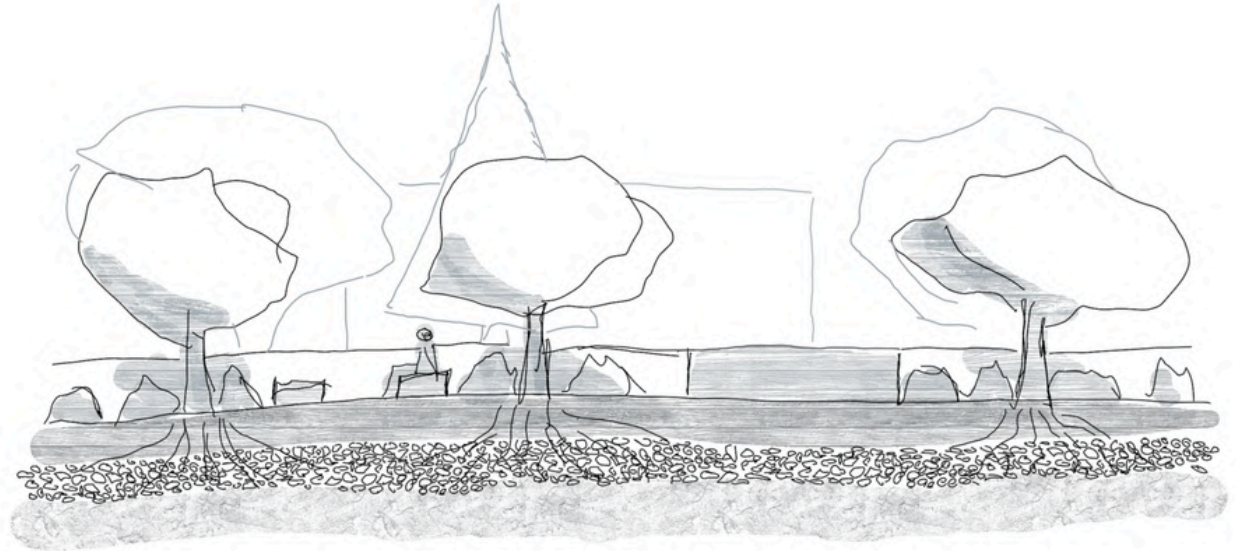

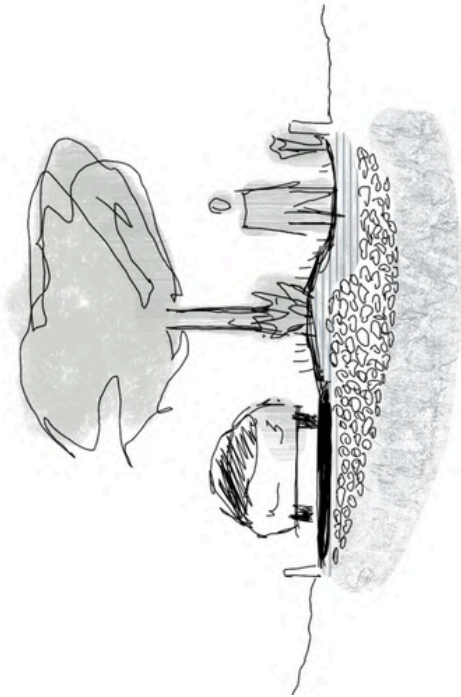

Landscape rehabilitation,
Stavros

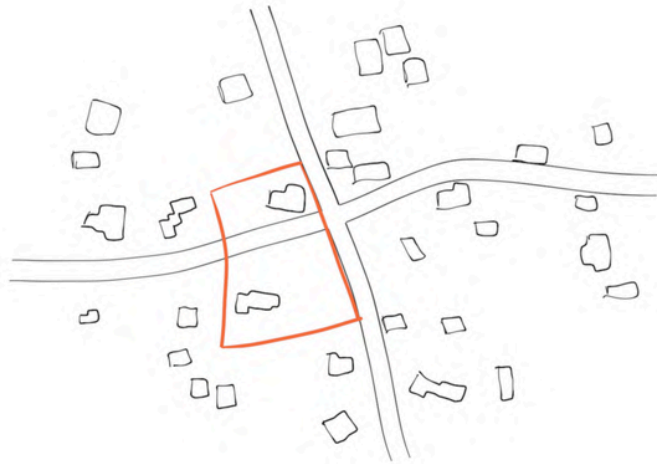

2024/25
Group

Landscape reconfiguration Chaniá, Greece

The beach town of Stavros, Chaniá, has the problem of being abandoned during off-turism seasons, and my group had to solve this issue. We intended to introduce objects into the landscape as landmarks (my colleagues' job), while also allowing for healthy and enjoyable walks between those (my job).

Hence, i reorganized the town streets to allow walkable paths (most are currently dirt roads), integrating local and nice-smelling plants - since heat and a constant breeze from the sea would enhance these plants' qualities.

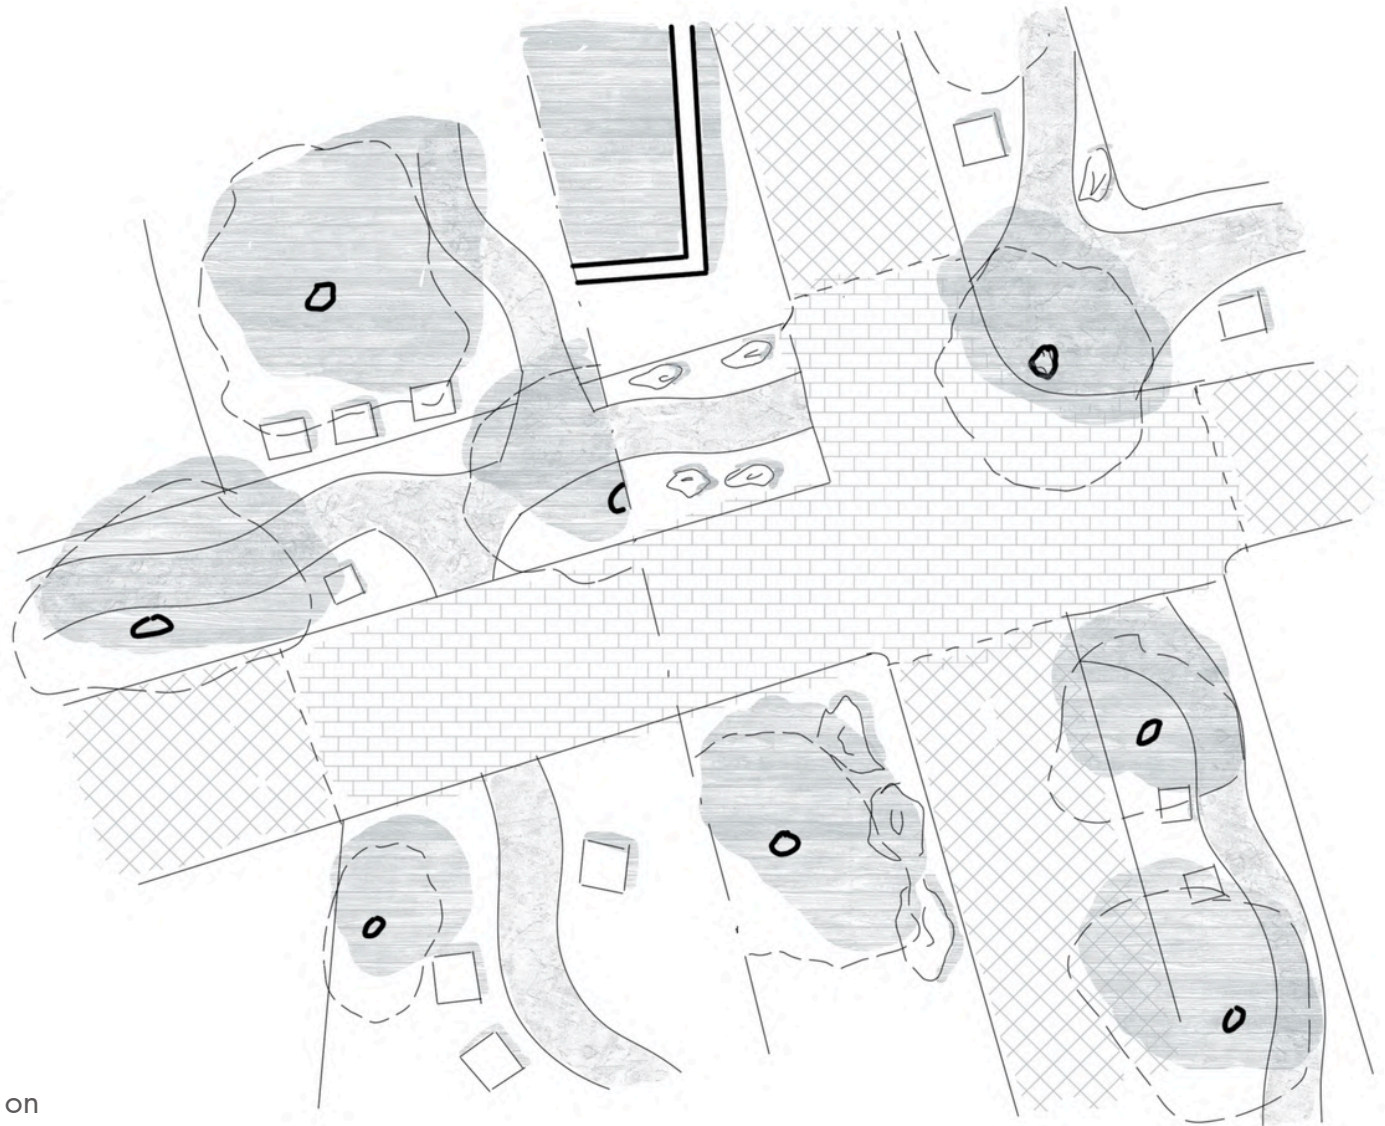

Vehicle and pedestrian path

Paper-work

Of personal interest

-/2025
Individual

If the previous maquetes were made mostly out of cardboard, is because of my passion for such material, one that is present in my life as a arts & crafts material since i was in middle school and i've been experimenting with since then, even getting to use cardboard and more recently paper mache and papercrete as furniture for my bedroom.

2

1- First boat i made out of cardboard and hotglue;

2- First human size (1,6m in lenght) boat i tried to do. Done with papercrete and a structure of cantilevers, before knowing what and how they worked;

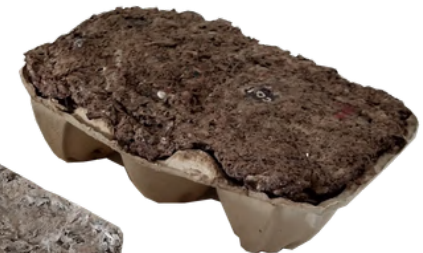

3- Various experiments of application of papercrete onto molds.

1

3

For that reason, i was interested in applying this knowledge into architecture maquetes. Since some teacher did like it, i then started to present the material not just for maquete-building, but also as possible part for buildings due to paper's properties, a rather good insulator, easy workability and, in an ecological scope, easy to recycle.

Sadly i never got to test on a laboratory the thermal, acoustic and fire resistant properties of this examples, but many papers corroborate paper based material potential.

4- Cilinder used to measure the drying since it's molded

5- Maquetes, at real scale, for and housing project, being:

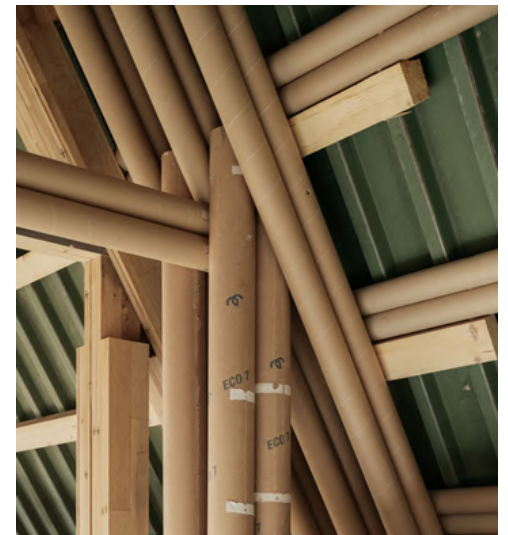

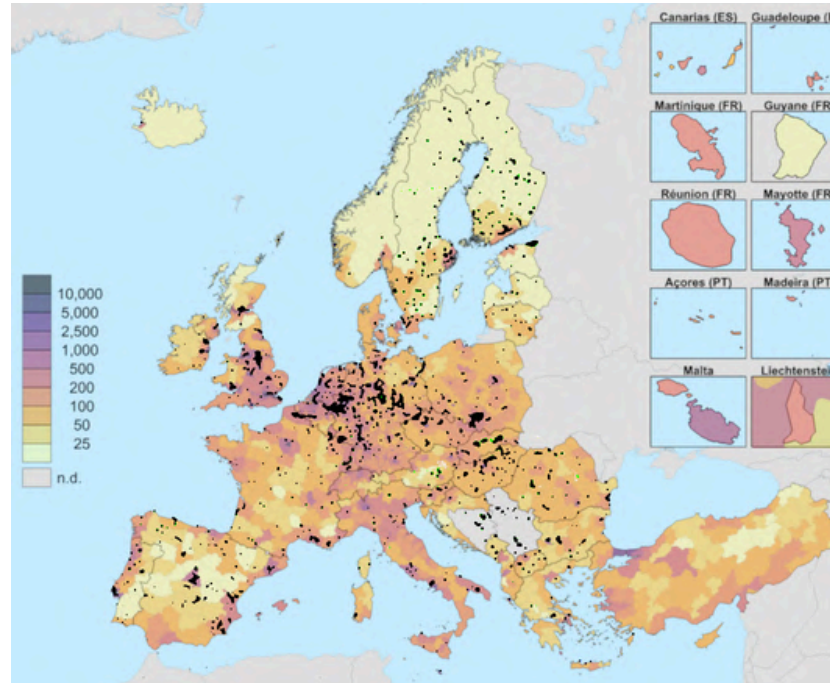

- 1'- slab and pavement section;
- 2'- wall section;
- 3'- pavement insulator;
- 4'- wall filling;
- 5'- reinforced plaster.

2025/26
Individual

Master Thesis (finishing...)

Due to my interest in wasted materials for building - being maquettes or even construction - i decided to research uses of urban solid waste as building materials. Currently writhing my thesis, that if i can will be delivered this june, if not next september.

Landfills and population density and examples of waste implemented in architecture/building materials
